## 2

## CHEMICAL ARITHMATICS

$W$ e know that atoms of different elements combine in simple whole-number ratios to form molecules. For example, hydrogen and oxygen atoms combine in the mass ratio of $1: 8$ and form water, $\mathrm{H}_{2} \mathrm{O}$. However, it is impossible to deal with individual atoms because they are so tiny that we can neither see nor weigh them. Therefore, we must increase the size of these quantities to the point where we can see them and weigh them. With the help of mole concept it is possible to take a desired number of atoms/molecules by weighing (please refer to lesson-1). Now, in order to study chemical compounds and reactions in the laboratory, it is necessary to have adequate knowledge of the quantitative relationship among the amounts of the reacting substances that take part and products formed in the chemical reaction. This relationship is know as stoichiometry. Stoichiometry (derived from the Greek Stoicheion $=$ element and metron $=$ measure) is the term we use to refer to all the quntatitative aspects of chemical compounds and reactions. In the present lesson, you will see how chemical formulae* are determined and how chemical equations prove useful in predicting the proper amounts of the reactants that must be mixed to carry out a complete reaction. In other words we can take reactants for a reaction in such a way that none of the reacting substances is in excess. This aspect is very vital in chemistry and has wide application in industries.

## Objectives

After reading this lesson, you will be able to :

- define empirical and molecular formulae;
- differentiate between empirical and molecular formulae;
- calculate precentage by mass of an element in a compound and also work out empirical formula from the percentage composition;
- establish relationship between mole, mass and volume;
- calculate the amount of substances consumed or formed in a chemical reaction using a balanced equation and mole concept, and

[^0]

Atoms, Molecules and Chemical Arithmatics

## Chemistry

- Explain that the amount of limiting reagent present initially limits the amount of the products formed.

### 2.1 Molcular and Empirical Formulae

In your previous classes, you have studied how to write chemical formula of a sustance. For example, water is represented by $\mathrm{H}_{2} \mathrm{O}$, carbon dioxide is represented by $\mathrm{CO}_{2}$, methane is represented by $\mathrm{CH}_{4}$, dinitrogen penta oxide is represented by $\mathrm{N}_{2} \mathrm{O}_{5}$, and so on. You are aware, formula for a molecule uses a symbol and subscript number to indicate the number of each kind of atoms present in the molcule (subscript 1 is always omitted). Such a formula is called molecular formula as it represents a molecule of a substance. A molecule of water consists of two hydrogen atoms and one oxygen atom. So its molecular formula is written as $\mathrm{H}_{2} \mathrm{O}$. Thus a molecular formula shows the actual number of atoms of different elements in a molecule of a compound.

There is another kind of formula, the empirical formul of a compound, which gives only relative number of atoms of different elements. These numbers are expressed as the simplest ratio. For example, empirical formula of glucose, which consists of carbon, hydrogen and oxygen in the ratio of $1: 2: 1$ is $\mathrm{CH}_{2} \mathrm{O}$ (empirical formulae are also called simplest formulae). Molecular formula of a substance is always an integral multiple of its empirical formula (i.e. molecular formula $=X_{n}$ where $X$ is empirical formula and $n$ is an integer). For example molecular formula of glucose is $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}$ which is $6 \times$ its empirical formula. Thus, while empirical formula gives only a ratio of atoms, the molecular formula gives the actual number of atoms of each element in an individual molecule. In some cases the ratio of atoms shown in a molecular formula cannot be reduced to smaller integers. In such cases molecular and empirical formulae are the same, for example, sucrose $\mathrm{C}_{12} \mathrm{H}_{22} \mathrm{O}_{11}$ which is popularly known as cane-sugar. In case of certain elements, a molecule consists of several atoms for example $\mathrm{P}_{4}, \mathrm{~S}_{8}$, etc. In such cases, empirical formula will be symbol of the element only.
As you know, common salt, which is chemically called sodium chloride is represented as NaCl . This salt is ionic in nature and does not exist in molecular form. Therefore, NaCl is its empirical formula which shows that sodium and chlorine atoms are present in NaCl in the ratio of 1:1. Similar is the case with all ionic substanes. $\mathrm{KCl}, \mathrm{NaNO}_{3}, \mathrm{MgO}$ are examples of empirical formulae as these are all ionic compounds. Table 2.1 provides a few more examples.

Table 2.1 Molecular and Empirical Formulae

| Substance | Molecular formula | Empirical formula |
| :--- | :---: | :---: |
| Ammonia | $\mathrm{NH}_{3}$ | $\mathrm{NH}_{3}$ |
| Carbon dioxide | $\mathrm{CO}_{2}$ | $\mathrm{CO}_{2}$ |
| Ethane | $\mathrm{C}_{2} \mathrm{H}_{6}$ | $\mathrm{CH}_{3}$ |
| Fructose | $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}$ | $\mathrm{CH}_{2} \mathrm{O}$ |
| Sulphur | $\mathrm{S}_{8}$ | S |
| Benzene | $\mathrm{C}_{6} \mathrm{H}_{6}$ | CH |
| Sodium chloride | - | NaCl |
| Calcium oxide | - | CaO |

## Chemical Arithmatics

### 2.2 Chemical Composition and Formulae

How much carbon is present in one kilogram of methane whose molecular formula is $\mathrm{CH}_{4}$ ? How much nitrogen is present in one kilogram of ammonia, $\mathrm{NH}_{3}$ ? If we have prepared a substance that is made of $58.8 \%$ carbon, $28.4 \%$ oxygen, $8.28 \%$ nitrogen and $6.56 \%$ hydrogen, what is its empirical formula? You have studied atomic masses, formulae, and the mole concept. Can we solve the problem using these basic concepts? The answer is 'yes'. Atomic masses, formulae and the mole concept are the basic tools needed to solve such problems. What is percentage composition? Let us take up this aspect in a little detail and try to understand.

### 2.2.1 Percentage Composition

If we know the formula of a compound, we can find out how much of each of the elements is present in a given quantity of the compound. Aluminium is obtained from its oxide. $\mathrm{Al}_{2} \mathrm{O}_{3}$ (which is found as the ore, bauxite). From the formula we can calculate how much aluminium can be obtained, at least in prinicple, from a given amount of aluminium oxide. Calculation is done by making use of the idea of percentage composition

> Percentage mass of an element in a compound
$=\frac{\text { mass of element in one molecular formula or in one empirical formula }}{\text { molecular mass or empirical formula mass of compound }} \times 100$
$=\frac{\text { Mass of element in } 1 \mathrm{~mol} \text { of compound }}{\text { Molar mass of compound }} \times 100$
Let us calculate percentage composition of aluminium oxide, $\mathrm{Al}_{2} \mathrm{O}_{3}$

$$
\text { Pecentage of aluminium }=\frac{\text { Mass of aluminium in } 1 \mathrm{~mol} \mathrm{Al}_{2} \mathrm{O}_{3}}{\text { Molar mass of } \mathrm{Al}_{2} \mathrm{O}_{3}} \times 100
$$

Molar mass of $\mathrm{Al}_{2} \mathrm{O}_{3}=(2 \times 27.0) \mathrm{g}+(3 \times 16.0) \mathrm{g}=102.0 \mathrm{~g}$
Since 1 mol of $\mathrm{Al}_{2} \mathrm{O}_{3}$ contains 2 mol of Al atoms, the mass of Al is $2 \times 27.0 \mathrm{~g}=54.0 \mathrm{~g} \mathrm{Al}$

$$
\text { Percentage of Aluminium }=\frac{54.0 \mathrm{~g}}{102.0 \mathrm{~g}} \times 100=52.9 \%
$$

We can calculate percentage of oxygen in the same way. One mole of $\mathrm{Al}_{2} \mathrm{O}_{3}$ contains 3 mole of O atoms, that is, $3 \times 16.0 \mathrm{~g}$ oxygen therefore

$$
\text { Percentage of oxygen }=\frac{3 \times 16.0 \mathrm{~g}}{102.0 \mathrm{~g}} \times 100=47.1 \%
$$

Example 2.1 : Butanoic acid, has the formula $\mathrm{C}_{4} \mathrm{H}_{8} \mathrm{O}_{2}$. What is the elemental analysis of butanoic acid?

Solution : Molecular formula of the butanoic acid is $\mathrm{C}_{4} \mathrm{H}_{8} \mathrm{O}_{2}$.

Atoms, Molecules and

Chemical Arithmatics

## Chemistry

In one mole of butanoic acid there are 4 mol of carbon atoms, 8 mol of hydrogen atoms and 2 mol of oxygen atoms. Thus, 1 molar mass of butanoic acid will be equal to the sum of $4 \times$ molar mass of carbon atoms, $8 \times$ molar mass of hydrogen atoms, and $2 \times$ molar mass of oxygen atoms.

Molar mass of butanoic acid $=4 \times 12.0 \mathrm{~g}+8 \times 1.0 \mathrm{~g}+2 \times 16.0 \mathrm{~g}=88.0 \mathrm{~g}$
Percentage of C by mass $=\frac{48.0 \mathrm{~g}}{88.0 \mathrm{~g}} \times 100=54.5 \%$
Percentage of H by mass $=\frac{8.0 \mathrm{~g}}{88.0 \mathrm{~g}} \times 100=9.1 \%$
Percentage of $O$ by mass $=\frac{32.0 \mathrm{~g}}{88.0 \mathrm{~g}} \times 100=36.4 \%$
The percentage of O in butanoic acid can also be calculated as follows :
Percentage of O by mass $=100-($ Percentage of C by mass + Percentage of H by mass $)$

$$
=100-(54.5+9.1)=36.4 \%
$$

### 2.3 Determination of Empirical Formulae Formula Stoichiometry

We have just seen that if we know the formula of a compound we can calculate the percentage composition. Now the question arises, can we determine the formula of the compound if we know the percentage composition of a compound. The answer will be 'yes', but this formula will not be molecular formula; instead it would be empirical formula as it would give simplest ratio of different atoms present in a compound. Normally we determine the percentage composition of different elements present in an unknown compound and determine its formula. Let us take a simple example of water. Water consists of $11.11 \%$ hydrogen and $88.89 \%$ oxygen by mass. From the data, we can determine empirical formula of water. Now if we assume that we have a 100.00 g sample of water, then the percentage composition tells us that 100.0 g of water contains 11.11 g of hydrogen atoms and 88.89 g of oxygen atoms.
From the atomic mass table, we find that 1 mol of hydrogn atoms has a mass of 1.0 g , and 1 mol of oxygen atoms has a mass of 16.0 g . Now we can write unit conversion factors so that the mass of hydrogen can be converted to moles of H atoms and the mass of oxygen can be converted to moles of O atoms. Since 1 mol of H atoms has a mass of 1.0 g we get the conversion factor as

$$
\frac{1 \mathrm{~mol} \mathrm{H} \text { atoms }}{1.0 \mathrm{~g} \mathrm{H}}
$$

Therefore
$11.11 \mathrm{~g} \mathrm{H}=(11.11 \mathrm{~g} \mathrm{H}) \frac{1 \mathrm{~mol} \mathrm{H} \text { atoms }}{1.0 \mathrm{~g} \mathrm{H}}=11.11 \mathrm{~mol} \mathrm{H}$ atoms

Similarly conversion factor for oxygen will be

$$
\frac{1 \mathrm{~mol} \mathrm{O} \text { atoms }}{16.0 \mathrm{~g} \mathrm{O}}
$$

Therefore, $88.89 \mathrm{~g} \mathrm{O}=(88.89 \mathrm{~g} \mathrm{O}) \frac{1 \mathrm{~mol} \mathrm{O} \text { atoms }}{16.0 \mathrm{~g} \mathrm{O}}=5.55 \mathrm{~mol} \mathrm{O}$ atoms
Thus in water, the ratio of moles of hydrogen atoms to moles of oxygen atoms is $11.11: 5.55$.

Since a mole of one element contains the same number of atoms as a mole of another element, the ratio of moles of atoms in a compound is also the ratio of the number of atoms. Therefore, the ratio of hydrogen atoms to oxygen atoms is 11.11:5.55. Now by dividing each by the smaller of the two numbers we can convert both numbers to integers

$$
\frac{11.11}{5.55}=2 \text { and } \frac{5.55}{5.55}=1
$$

Thus ratio hydrogen and oxygen atoms in water is $2: 1$ and empirical formula of water is $\mathrm{H}_{2} \mathrm{O}$.

## Intext Questions 2.1

1. For the compound $\mathrm{Fe}_{3} \mathrm{O}_{4}$, calculate percentage of Fe and O .
2. State percent composition for each of the following:
(a) C in $\mathrm{SrCO}_{3}$
(b) $\mathrm{SO}_{3}$ in $\mathrm{H}_{2} \mathrm{SO}_{4}$
3. What are the empirical formulae of substances having the following molecular formulae?
$\mathrm{H}_{2} \mathrm{O}_{2}, \mathrm{C}_{6} \mathrm{H}_{12}, \mathrm{Li}_{2} \mathrm{CO}_{3}, \mathrm{C}_{2} \mathrm{H}_{4} \mathrm{O}_{2}, \mathrm{~S}_{8}, \mathrm{H}_{2} \mathrm{O}, \mathrm{B}_{2} \mathrm{H}_{6}, \mathrm{O}_{3}, \mathrm{~S}_{3} \mathrm{O}_{9}, \mathrm{~N}_{2} \mathrm{O}_{3}$
4. A compound is composed of atoms of only two elements, carbon and oxygen. If the compound contain $53.1 \%$ carbon, what is its empirical formula.

### 2.4 Chemical Equation and Reaction Stoichiometry

You have studied that a reaction can be represented in the form of a chemical equation. A balanced chemical equation carries a wealth of information qualitative as well as quantitative. Let us consider the following equation and learn what all information it carries.

$$
\begin{equation*}
4 \mathrm{Fe}(\mathrm{~s})+3 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{Fe}_{2} \mathrm{O}_{3}(\mathrm{~s}) \tag{2.1}
\end{equation*}
$$

$\mathrm{H}_{2} \mathrm{C}_{12}, \mathrm{Li}_{2} \mathrm{CO}_{3}, \mathrm{C}_{2} \mathrm{H}_{4} \mathrm{O}_{2}, \mathrm{~S}_{8} \mathrm{H}_{2} \mathrm{O}, \mathrm{B}_{2} \mathrm{H}_{4} \mathrm{O}_{3}, \mathrm{~S}_{3} \mathrm{O}_{2} \mathrm{~N}_{2}$
$\qquad$

Atoms, Molecules and Chemical Arithmatics

## Chemistry

(1) Qualitative Information

Qualitatively the equation (2.1) tells that iron reacts with oxygen to form iron oxide.

## (2) Quantitative Information

Quantitatively a balanced chemical equation specifies numerical relationship among the quantities of its reactants and products. These relationships can be expressed in terms of
(i) Microscopic quantities, namely, atoms, molecules and formula units.
(ii) Macroscopic quantities, namely, moles, masses and volumes (in case of gaseous substances) of reactants and products.

Now let us again take the reaction (2.1) given earlier and get the quantitative information out of it.

### 2.4.1 Microscopic Quantitative Information

The reaction (2.1)

$$
\begin{equation*}
4 \mathrm{Fe}(\mathrm{~s})+3 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow \quad 2 \mathrm{Fe}_{2} \mathrm{O}_{3}(\mathrm{~s}) \tag{2.1}
\end{equation*}
$$

tells that 4 atoms of iron react with 3 molecules of oxygen to form 2 formula units of iron oxide. Often this information is written below each reactant and product for ready reference as shown below:

$$
\begin{equation*}
\underset{\text { 4 atoms of } \mathrm{Fe}}{4 \mathrm{Fe}(\mathrm{~s})}+\underset{\text { 3 molecules of } \mathrm{O}_{2}}{3 \mathrm{O}_{2}(\mathrm{~g})} \quad \rightarrow \underset{\text { 2 formula units of } \mathrm{Fe}_{2} \mathrm{O}_{3}}{2 \mathrm{Fe}_{2} \mathrm{O}_{3}(\mathrm{~s})} \tag{2.1a}
\end{equation*}
$$

### 2.4.2. Macroscopic Quantitative Information

The microscopic quantitative information discussed in the previous section can be converted into macroscopic information with the help of mole concept which you have learnt in unit 1 .

## (a) Mole Relationships

We know that Avogadro number of elementary entities like atoms, molecules, ions or formula units of a substance constitute one mole of it. Let us multiply the number of atoms, molecules and formula masses obtained in the previous section (Eq.2.1a) by Avogadro's constant, $\mathrm{N}_{\mathrm{A}}$

We may rewrite the above equation as

$$
\begin{align*}
& 4 \mathrm{Fe}(\mathrm{~s})  \tag{2.1b}\\
& \mathbf{4} \mathbf{~ m o l ~ o f ~} \mathrm{Fe}
\end{aligned} \quad+\begin{aligned}
& 3 \mathrm{O}_{2}(\mathrm{~g}) \\
& \mathbf{3} \mathbf{~ m o l ~ o f ~} \mathrm{O}_{2}
\end{aligned} \quad \rightarrow \quad \begin{aligned}
& 2 \mathrm{Fe}_{2} \mathrm{O}_{3}(\mathrm{~s}) \\
& \mathbf{2 ~ m o l ~ o f ~} \mathrm{Fe}_{2} \mathrm{O}_{3}
\end{align*}
$$

The above equation (2.1b) gives us the mole relationship between reactants and products. Here 4 mol of Fe react with 3 mol of $\mathrm{O}_{2}$ and produce 2 mol of $\mathrm{Fe}_{2} \mathrm{O}_{3}$.

## (b) Mass Relationships

The mole relationships which you have learnt in the previous section, can be converted into mass relationship by using the fact that mass of one mole of any substance is equal to its molar mass which can be calculated from its formula with the help of relative atomic masses of its constituent elements.

In the reaction that we are discussing, the relative atomic masses of iron and oxygen are 55.8 and 16.0 respectively. Therefore
(i) molar mass of $\mathrm{Fe} \quad=55.8 \mathrm{~g} \mathrm{~mol}^{-1}$
(ii) molar mass of $\mathrm{O}_{2} \quad=2 \times 16.0=32 \mathrm{~g} \mathrm{~mol}^{-1}$
(iii) molar mass of $\mathrm{Fe}_{2} \mathrm{O}_{3}=(2 \times 55.8+3 \times 16.0) \mathrm{g} \mathrm{mol}^{-1}$

$$
=159.6 \mathrm{~g} \mathrm{~mol}^{-1}
$$

Using these molar masses we can convert the mole relationship given by equation 2.1b into mass relationship as given below :

| 4 Fe (s) | + | $3 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow$ | $2 \mathrm{Fe}_{2} \mathrm{O}_{3}(\mathrm{~s})$ |
| :---: | :---: | :---: | :---: |
| 4 mol Fe |  | $3 \mathrm{~mol} \mathrm{O}_{2}$ | $2 \mathrm{~mol} \mathrm{Fe} \mathrm{O}_{3}$ |
| $(4 \times 55.8) \mathrm{g} \mathrm{Fe}$ |  | $(3 \times 32) \mathrm{g} \mathrm{O}^{2}$ | $(2 \times 159.6) \mathrm{gFe}_{2} \mathrm{O}_{3}$ |
| 223.2 gFe |  | $96 \mathrm{gO}_{2}$ | $319.2 \mathrm{~g} \mathrm{Fe}_{2} \mathrm{O}_{3}$ |

Thus 223.2 g iron would react with 96 g oxygen and produce 319.2 g iron oxide, We may rewrite the above equation as

$$
\begin{array}{ll}
4 \mathrm{Fe}(\mathrm{~s})  \tag{2.1c}\\
\mathbf{2 2 3 . 2} \mathbf{~ g ~ F e}
\end{array}+\quad \begin{aligned}
& 3 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow \\
& \mathbf{9 6} \mathbf{g ~ O}_{2}
\end{aligned} \quad \begin{aligned}
& 2 \mathrm{Fe}_{2} \mathrm{O}_{3}(\mathrm{~s}) \\
& \mathbf{3 1 9 . 2} \mathbf{g ~ F e}_{2} \mathrm{O}_{3}
\end{aligned}
$$

## (c) Volume Relationships

We know that one mole of any gas occupies a volume of 22.7 L* at STP (standard $^{*}$ temperature and pressure, $0^{\circ} \mathrm{C}$ and 1 bar pressure). We can use this information to arrive at volume relationships between gaseous substances. The reaction that we are considering involves only one gaseous substance, $\mathrm{O}_{2}$. We may rewrite the equation (2.1b) as

| $4 \mathrm{Fe}(\mathrm{s})$ |  |  |  |
| :--- | :--- | :--- | :---: |
| $\mathbf{4}$ mol | + | $3 \mathrm{O}_{2}(\mathrm{~g}) \quad \rightarrow$ | $2 \mathrm{Fe}_{2} \mathrm{O}_{3}(\mathrm{~s})(2.1 \mathrm{~b})$ |
|  |  | $\mathbf{3} \mathbf{~ m o l}$ |  |
|  |  | $(3 \times 22.7)$ Lat STP |  |
|  |  | 68.1 LatSTP |  |

Thus 4 mol of iron would react with 68.1 L of oxygen at STP to produce 2 mol of iron oxide. (The volume relationship becomes more useful for reactions involving 2 or more gaseous substances).

[^1]Atoms, Molecules and Chemical Arithmatics

## Chemistry

We can express microscopic as well macroscopic quantitative relationships involved in the above reaction as shown below:

| $4 \mathrm{Fe}(\mathrm{s})$ | + | $3 \mathrm{O}_{2}(\mathrm{~s})$ | $\rightarrow$ |
| :--- | :--- | :--- | :--- | $\mathbf{2 F e}_{2} \mathrm{O}_{3}(\mathrm{~s})$.

We may use even mixed relations. For example, we may say 4 mol of iron would react with 68.1 L (at STP) of oxygen to produce 319.2 g of iron oxide.

Let us understand these relationships with two more examples.
(a) Let us work out the mole, mass and volume relationships for the reaction involved in manufacture of ammonia by Haber's process.

| Microscopic relationship | $\mathrm{N}_{2}(\mathrm{~g})$ | $+3 \mathrm{H}_{2}(\mathrm{~g}) \longrightarrow$ | $2 \mathrm{NH}_{3}(\mathrm{~g}) \quad . . .(2.2$ |
| :---: | :---: | :---: | :---: |
| Microscopic relationships | 1 Molecule | 3 Molecules | 2 Molecules |
| (i) Moles | 1 mol | 3 mol | 2 mol |
| (ii) Mass | 28 g | $(3 \times 2.0)=6.0 \mathrm{~g}$ | $(2 \times 17.0)=34 \mathrm{~g}$ |
| (iii) Volume | $1 \times 22.7 \mathrm{~L}$ | $(3 \times 22.7)$ | $(2 \times 22.7)$ |
|  | $=22.7 \mathrm{~L}$ | $=68.1 \mathrm{~L}$ | $=45.4 \mathrm{~L}$ |
| or | 1 vol | 3 vol | 2 vol |

(b) Let us take one more reaction, the combustion reaction of butane and work out the different types of relationships. The reaction is :

| $2 \mathrm{C}_{4} \mathrm{H}_{10}(\mathrm{~g})$ | $+$ | $13 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow$ | $8 \mathrm{CO}_{2}(\mathrm{~g})+$ | $10 \mathrm{H}_{2} \mathrm{O}(\mathrm{g})$ |
| :---: | :---: | :---: | :---: | :---: |
| 2 molecules |  | 13 molecules | 8 molecules | 10 molecules |
| 2 mol |  | 13 mol | 8 mol | 10 mol |
| $2 \times(4 \times 12+10 \times 1) \mathrm{g}$ |  | $(13 \times 32) \mathrm{g}$ | $8 \times(12+2 \times 16) \mathrm{g}$ | $10 \times(2 \times 1+16) \mathrm{g}$ |
| 116 g |  | 416 g | 352 g | 180 g |
| $2 \times 22.7=45.4 \mathrm{~L}$ |  | $13 \times 22.7=295.1 \mathrm{~L}$ | $8 \times 22.7=181.6 \mathrm{~L}$ | $10 \times 22.7=227 \mathrm{~L}$ |
| 2 vol |  | 13 vol | 8 vol | 10 vol |

Now let us use the mole, mass and volume relationships to make some calculations.
Example 2.2 In the manufacture of ammonia by Haber process, nitrogen reacts with hydrogen at high temprature and high pressure in the presence of a catalyst and gives ammonia.

$$
\mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \longrightarrow 2 \mathrm{NH}_{3}(\mathrm{~g})
$$

How much hydrogen would be needed to produce one metric ton of ammonia?
Solution : We should first find out the mass relationships for the reaction.

| $\mathrm{N}_{2}(\mathrm{~g})$ | $3 \mathrm{H}_{2}(\mathrm{~g})$ | $2 \mathrm{NH}_{3}(\mathrm{~g})$ |
| :---: | :---: | :---: |
| 1 mol | 3 mol | 2 mol |
| $\times 28 \mathrm{~g}=28 \mathrm{~g}$ | $3 \times 2 \mathrm{~g}=6.0 \mathrm{~g}$ | $2 \times 17 \mathrm{~g}=3$ |

We know that :

$$
1 \text { metric ton }=1000 \mathrm{~kg}=10^{3} \mathrm{~kg}=10^{6} \mathrm{~g}
$$

From the mass relationship $34 \mathrm{~g} \mathrm{NH}_{3}$ requires $6.0 \mathrm{~g} \mathrm{H}_{2}$ for its manufacture.
$\therefore 10^{6} \mathrm{~g} \mathrm{NH}_{3}$ would require $\frac{6.0 \times 10^{6}}{34} \mathrm{~g}=1.76 \times 10^{5} \mathrm{~g}$ of $\mathrm{H}_{2}$.
Thus 1 metric ton of ammonia will be obtained by using $1.176 \times 10^{5} \mathrm{~g}$ of Hydrogen. $\qquad$

Atoms, Molecules and Chemical Arithmatics

Example 2.3 In a rocket motor fuelled by butane, $\mathrm{C}_{4} \mathrm{H}_{10}$, how many kg of $\mathrm{O}_{2}$ should be provided with each kg of butane to provide for complete combustion?

Solution : $\quad$ The combustion reaction of butane is

Thus, to completely burn 116 g butane, oxygen required is 416 g .
Therefore, to completely burn $1 \mathrm{~kg}(1000 \mathrm{~g})$ butane, oxygen required will be

$$
\begin{aligned}
& =\frac{416 \times 1000}{116} \mathrm{~g} \mathrm{O}_{2} \\
& =3586 \mathrm{~g} \mathrm{O}_{2} \\
& =3.586 \mathrm{~kg} \mathrm{O}_{2} \approx 3.59 \mathrm{~kg} \mathrm{O}_{2}
\end{aligned}
$$

| Example 2.4 When lead sulphide; PbS and lead oxide, PbO , are heated together the products are lead metal and sulphur dioxide, $\mathrm{SO}_{2}$,

$$
\mathrm{PbS}(\mathrm{~s})+2 \mathrm{PbO}(\mathrm{~s}) \xrightarrow{\text { heat }} 3 \mathrm{~Pb}(1)+\mathrm{SO}_{2}(\mathrm{~g})
$$

If 14.0 g of lead oxide reacts according to the above equation, how many (a) moles of lead (b) grams of lead, (c) atoms of lead and (d) grams of sulphur dioxide are formed?
(Atomic mass : $\mathrm{Pb}=207.0, \mathrm{~S}=32.1 ; \mathrm{O}=16.0$ )
Solution : $\quad$ For each part of the question we will use the balanced equation

$$
\underset{\mathbf{1 m o l}}{\mathrm{PbS}(\mathrm{~s})}+\underset{\mathbf{2 m o l}}{2 \mathrm{PbO}(\mathrm{~s})} \xrightarrow{\text { heat }} \underset{\mathbf{3} \mathbf{~ m o l}}{3 \mathrm{~Pb}}(1)+\underset{\mathbf{1 m o l}}{\mathrm{SO}_{2}(\mathrm{~g})}
$$

Now formula mass of $\mathrm{PbO}=(207.0+16.0)=223.0 \mathrm{amu}$

Thus, one mole of lead oxide formula units have a mass of 223.0 g . Therefore, 14.0 g of PbO is $\frac{14.0 \mathrm{~g} \mathrm{PbO}}{223.0 \mathrm{~g} \mathrm{~mol}^{-1} \mathrm{PbO}}=6.28 \times 10^{-2} \mathrm{~mol} \mathrm{PbO}$

MODULE-1
Atoms, Molecules and ChemicalArithmatics

## Chemistry

(a) The balanced equation shows that 2 mol of PbO form 3 mol of Pb . Therefore, $6.28 \times 10^{-2} \mathrm{~mol}$ of PbO form

$$
6.28 \times 10^{-2} \mathrm{~mol} \mathrm{PbO} \times \frac{3 \mathrm{~mol} \mathrm{~Pb}}{2 \mathrm{~mol} \mathrm{PbO}}=9.42 \times 10^{-2} \mathrm{~mol} \mathrm{~Pb}
$$

(b) The atomic mass of Pb is 207.0 ; this tells us that one mol of lead has a mass 207.0 g . Thus, $9.42 \times 10^{-2} \mathrm{~mol}$ of Pb has a mass of

$$
9.42 \times 10^{-2} \mathrm{~mol} \mathrm{~Pb} \times \frac{207.0 \mathrm{~g} \mathrm{~Pb}}{1 \mathrm{~mol} \mathrm{~Pb}}=19.5 \mathrm{~g} \mathrm{~Pb}
$$

(c) $\quad 9.42 \times 10^{-2} \mathrm{~mol}$ of Pb is
$9.42 \times 10^{-2} \mathrm{~mol}$ of $\mathrm{Pb} \times 6.022 \times 10^{23}$ atoms $\mathrm{mol}^{-1}=5.67 \times 10^{22} \mathrm{~Pb}$ atoms
(d) The balanced equation shows that 2 mol of PbO form 1 mol of $\mathrm{SO}_{2}$.

Therefore, $6.28 \times 10^{-2} \mathrm{~mol}$ of PbO formula unit forms

$$
\begin{aligned}
6.28 \times 10^{-2} \mathrm{~mol} \mathrm{PbO} \times & \frac{1 \mathrm{~mol} \mathrm{SO}_{2}}{2 \mathrm{~mol} \mathrm{PbO}} \\
& =3.14 \times 10^{-2} \mathrm{~mol} \mathrm{SO}_{2}
\end{aligned}
$$

Now the relative molecular mass of $\mathrm{SO}_{2}=32.1+2(16.0)=64.1$
Molar mass of $\mathrm{SO}_{2}=64.1 \mathrm{~g} \mathrm{~mol}^{-1}$
Therefore, $3.14 \times 10^{-2} \mathrm{~mol}$ of $\mathrm{SO}_{2}$ molecules have a mass of $3.14 \times 10^{-2} \mathrm{~mol} \times 64.1 \mathrm{~g} \mathrm{~mol}^{-1}$

$$
=2.01 \mathrm{~g}
$$

## Intext Questions 2.2

(1) How many grams of $\mathrm{NH}_{3}$ can be made according to the reaction
$\mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \longrightarrow 2 \mathrm{NH}_{3}(\mathrm{~g})$
from (a) 0.207 mol of $\mathrm{N}_{2}$ (b) 22.6 g of $\mathrm{H}_{2}$
$\qquad$
(2) In reaction
$\mathrm{C}_{2} \mathrm{H}_{4}(\mathrm{~g})+3 \mathrm{O}_{2}(\mathrm{~g}) \longrightarrow 2 \mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\ell)$
How many (a) moles of $\mathrm{O}_{2}$ are consumed and (b) moles of $\mathrm{H}_{2} \mathrm{O}$ are formed when $4.16 \times 10^{-2} \mathrm{~mol}^{\text {of }} \mathrm{C}_{2} \mathrm{H}_{4}$ react?

### 2.5 Limiting Reagents

We generally find that substances which react with each other are not present in exactly the same proportionin a reaction mixture as stated by a balanced chemical equation. For example, if 2 mol each of hydrogen and oxygen are mixed and a spark is passed through the mixture, water is formed, according to the equation

Here, 2 mol of hydrogen react with only 1 mol of oxygen, and 1 mol of oxygen therefore remains unreacted. In this example hydrogen is said to be the limiting reagent or reactant because its amount becomes zero and the reaction therefore stops before the other reactant; that is, the oxygen is used up. The amount of hydrogen present initially limits the amount of product that is formed.

Example 2.5 3 mol of sulphur dioxide $\mathrm{SO}_{2}$ is mixed with 2 mol of oxygen $\mathrm{O}_{2}$, and after reaction is over sulphur trioxide, $\mathrm{SO}_{3}$ is obtained.
(i) Which is the limiting reagent?
(ii) What is the maximum amount of $\mathrm{SO}_{3}$ that can be formed?

Solution : (i) We must first write the balanced equation

$$
2 \mathrm{SO}_{2}+\mathrm{O}_{2} \rightarrow 2 \mathrm{SO}_{3}
$$

According to the above equation
(a) 2 mol of $\mathrm{SO}_{3}$ can be formal from 2 mol of $\mathrm{SO}_{2}$.
$\therefore$ Amount of $\mathrm{SO}_{3}$ that can be formed from 3 mol of $\mathrm{SO}_{2}$.

$$
=\left(3 \mathrm{~mol} \mathrm{SO}_{2}\right) \times \frac{2 \mathrm{~mol} \mathrm{SO}_{3}}{2 \mathrm{~mol} \mathrm{SO}_{2}}=3 \mathrm{~mol} \mathrm{SO}_{3}
$$

(b) 2 mol of $\mathrm{SO}_{3}$ can be formed from 1 mol of $\mathrm{O}_{2}$. Therefore, the amount of $\mathrm{SO}_{3}$ that can be formed from 2 mol of $\mathrm{O}_{2}$.

$$
=\left(2 \mathrm{~mol} \mathrm{O}_{2}\right) \quad \times \frac{2 \mathrm{~mol} \mathrm{SO}_{3}}{1 \mathrm{~mol} \mathrm{O}_{2}}=4 \mathrm{~mol} \mathrm{SO}_{3}
$$

According to the definition, the limiting reactant is that reactant which gives the smallest amount. In this case $\mathrm{SO}_{2}$ is the limiting reactant.
(ii) The maximum amount of product that can be obtained is the amount formed by the limiting reagent. Thus a the maximum amount of $\mathrm{SO}_{3}$ that can be obtained is 3 mol .

Example 2.6 2.3 g of sodium metal is introduced into a 2 L flask filled with chlorine gas at STP ( $273 \mathrm{~K}, 1 \mathrm{bar}$ ). After the reaction is over, find :
(i) What is the limiting reagent in this reaction?

MODULE-1
Atoms, Molecules and Chemical Arithmatics

## Chemistry

(ii) How many moles of sodium chloride are formed?
(iii) Which substance is left unconsumed at the end of the reaction? Find out its mass in grams.
(iv) What percentage of the substance present in excess is converted into sodium chloride?
(Given : $\mathrm{Na}=23, \mathrm{Cl}=35.5$ )

## Solution :

$\underset{\text { 2mol }}{2 \mathrm{Na}(\mathrm{s})}+\underset{\substack{\text { 1 mol } \\ \text { 22.7 LatSTP }}}{\mathrm{Cl}_{2}(\mathrm{~g})} \longrightarrow \underset{\mathbf{2 ~ m o l}}{2 \mathrm{NaCl}(\mathrm{s})}$
(i) Moles of sodium introduced $=\frac{2.3 \mathrm{~g}}{23 \mathrm{~g} \mathrm{~mol}^{-1}}=0.1 \mathrm{~mol}$

From the above equation, it is clear that 2 mol NaCl is formed from 2 mol Na
Therefore 0.1 mol Na can produce $=\frac{2 \times 0.1}{2}=0.1 \mathrm{~mol} \mathrm{NaCl}$
Molar volume at $\mathrm{STP}=22.7 \mathrm{~L}$
Therefore moles of chlorine in 2 L volume at $\mathrm{STP}=\frac{2 \mathrm{~L}}{22.7 \mathrm{~L} \mathrm{~mol}^{-1}}=0.088 \mathrm{~mol}$
From equation : $1 \mathrm{~mol} \mathrm{Cl}_{2}$ can produce 2 mol NaCl
Therefore $0.088 \mathrm{~mol} \mathrm{Cl}_{2}$ can produce $2 \times 0.088=0.176 \mathrm{~mol} \mathrm{NaCl}$.
Since sodium produces less amount of NaCl , it is the limiting reagent.
(ii) Sodium being the limiting reagent, as calculated in (i), the moles of NaCl produced $=0.1 \mathrm{~mol}$
(iii) From above equation, 2 mol NaCl is produced from $1 \mathrm{~mol} \mathrm{Cl}_{2}$

Therefore 0.1 mol NaCl is produced from $\frac{1 \times 0.1}{2}=0.05 \mathrm{~mol} \mathrm{Cl}_{2}$
Initial moles of $\mathrm{Cl}_{2}=0.088 \mathrm{~mol}$
Moles of $\mathrm{Cl}_{2}$ left unconsumed $=(0.088-0.05) \mathrm{mol}=0.038 \mathrm{~mol}$
Therefore, mass of $\mathrm{Cl}_{2}$ left unconsumed $=0.038 \mathrm{~g} \times 71.0 \mathrm{~g} \mathrm{~mol}^{-1}=2.698 \mathrm{~g}$
(because molar mass of $\mathrm{Cl}_{2}=2 \times 35.5=71.0 \mathrm{~g} \mathrm{~mol}^{-1}$ )
(iv) Moles of $\mathrm{Cl}_{2}$ consumed $=0.05 \mathrm{~mol}$ out of 0.088 mol
$\therefore$ Percent of $\mathrm{Cl}_{2}$ consumed and converted into $\mathrm{NaCl}=\frac{0.05}{0.088} \times 100=56.8 \%$

Example 2.7: 2.0 g mixture of $\mathrm{MgCO}_{3}$ and $\mathrm{CaCO}_{3}$ are heated till no further loss of weight takes place. The residue weighs 1.04 g . Find the percentage composition of the mixture. $(\mathrm{Mg}=24, \mathrm{Ca}=40, \mathrm{C}=12, \mathrm{O}=16)$

Solution : $\quad$ Mixture of $\mathrm{MgCO}_{3}$ and $\mathrm{CaCO}_{3}$ taken $=2.0 \mathrm{~g}$ Let the mass of $\mathrm{MgCO}_{3}$ be $=x \mathrm{~g}$

Therefore the mass of $\mathrm{CaCO}_{3}=(2.0-x) \mathrm{g}$

## Notes

The decomposition reactions are

| $\begin{aligned} & \mathrm{MgCO}_{3}(\mathrm{~s}) \\ & (\mathbf{2 4 + 1 2 + 4 8}) \mathrm{g} \end{aligned}$ | $\rightarrow$ | $\begin{aligned} & \mathrm{MgO}(\mathrm{~s})+ \\ & (\mathbf{2 4 + 1 6}) \mathrm{g} \end{aligned}$ | $\mathrm{CO}_{2}(\mathrm{~g})$ | (i) |
| :---: | :---: | :---: | :---: | :---: |
| 84 g |  | 40 g (Residue) |  |  |
| $\mathrm{CaCO}_{3}(\mathrm{~s})$ | $\rightarrow$ | $\mathrm{CaO}(\mathrm{s})+$ | $\mathrm{CO}_{2}(\mathrm{~g})$ | (ii) |
| $(40+12+48) \mathrm{g}$ |  | $(40+16) \mathrm{g}$ |  |  |
| 100 g |  | 56 g (Residue) |  |  |

From the equation (i)

$$
\begin{aligned}
& 84 \mathrm{~g} \mathrm{MgCO}_{3} \text { leaves a residue }=40 \mathrm{~g} \\
& x \mathrm{~g} \mathrm{MgCO}_{3} \text { will leave residue }=\frac{40 x}{84} \mathrm{~g}
\end{aligned}
$$

From the equation (ii)

$$
\begin{aligned}
& 100 \mathrm{~g} \mathrm{CaCO}_{3} \text { leaves a residue }=56 \mathrm{~g} \\
& (2.0-x) \mathrm{g} \mathrm{CaCO}_{3} \text { will leave residue }=\frac{56 \times(2.0-x)}{100} \mathrm{~g}
\end{aligned}
$$

Total mass of the residue $=\frac{40 x}{84}+\frac{56 \times(2.0-x)}{100}=1.04 \mathrm{~g}$ (given)
$40 \times 100 x+84 \times 56 \times 2-84 \times 56 x=84 \times 100 \times 1.04$

$$
4000 x+9408-4704 x=8736
$$

$$
9408-8736=(4704-4000) x
$$

$$
672=704 x
$$

Therefore, mass of $\mathrm{MgCO}_{3}$ in the mixture $=x=\frac{672}{704}=0.96 \mathrm{~g}$
Therefore, percentage of $\mathrm{MgCO}_{3}=\frac{0.96}{2.0} \times 100=48 \%$
and percentage of $\mathrm{CaCO}_{3}=100-48=52 \%$

Atoms, Molecules and Chemical Arithmatics

## Chemistry

## What You Have Learnt

- A chemical formula is used not only to represent the name of a compound but also to indicate its composition in terms of (i) relative number of atoms and (ii) relative number of moles of atoms.
- A molecular formula of a substance shows(i) the number of atoms of different elements in one molecule.(ii) the number of moles of atoms of different elements in one mole of molecule.
- An empirical formula shows only a ratio of (i) number of atoms, and (ii) moles of atoms in a compound.
- Molecular formula is always an integral multiple of the empirical formula.
- The empirical formula of a compound can be determined from its chemical analysis.
- In order to determine a compound's molecular formula, molecular mass also must be known.
- Stoichiometry is the quantitative study of the composition of chemical compounds (compound or formula stoichiometry) and of the substances consumed and formed in chemical reactions (reaction or equation stoichiometry).
- Chemical equations specify not only the identities of substances consumed and formed in a reaction, but also the relative quantities of these substances in terms of (a) atoms, molecules, and formula units and (b) moles of these entities.
- A balanced chemical equation demonstrates that all the atoms present in the reactants are accounted for in the product; atoms are neither created nor destroyed in a reaction.
- The stoichiometric ratios among the moles of reactants shown in a balanced equation are useful for determining which substance is entirely consumed and which substance(s) is (are) left over.

## Terminal Exercise

1. Write empirical formulae of the following compounds:

$$
\mathrm{CO}, \mathrm{Na}_{2} \mathrm{SO}_{3}, \mathrm{C}_{4} \mathrm{H}_{10}, \mathrm{H}_{2} \mathrm{O}_{2}, \mathrm{KCl}
$$

2. The empirical formula of glucose is $\mathrm{CH}_{2} \mathrm{O}$ which has a formula mass of 30 amu . If the molecular mass of glucose is 180 amu . Determine the molecular formula of glucose
3. What is ratio of masses of oxygen that are combined with 1.0 gram of nitrogen in the compound NO and $\mathrm{N}_{2} \mathrm{O}_{3}$ ?
$\qquad$
4. A compound containing sulphur and oxygen on analysis reveals that it contains $50.1 \%$ sulphur and $49.9 \%$ oxygen by mass. What is the simplest formula of the compound?
5. Hydrocarbons are organic compound composed of hydrogen and carbon. A, 0.1647 g sample of a pure hydrocarbon on burning in a combustion tube produced 0.5694 g of $\mathrm{CO}_{2}$ and 0.0845 g of $\mathrm{H}_{2} \mathrm{O}$. Determine the percentage of these elements in the hydrocarbon.
6. On combustion 2.4 g of a compound of carbon, hydrogen and oxygen gave 3.52 g of $\mathrm{CO}_{2}$ and 1.44 g of $\mathrm{H}_{2} \mathrm{O}$. The molecular mass of the compound was found to be 60.0 amu.
(a) What are the masses of carbon, hydrogen and oxygen in 2.4 g of the compound?
$\qquad$
(b) What are the empirical and molecular formulae of the compound?
7. (i) What mass of oxygen is required to react completely with 24 g of $\mathrm{CH}_{4}$ in the following reaction?

$$
\mathrm{CH}_{4}(\mathrm{~g})+2 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(1)
$$

(ii) How much mass of $\mathrm{CH}_{4}$ would react with 96 g of oxygen.
8. In the reaction $\mathrm{H}_{2}+\mathrm{C1}_{2} \rightarrow 2 \mathrm{HC1}$

How many grams of chlorine, $\mathrm{C1}_{2}$ are needed to react completely with 0.245 g of hydrogen, $\mathrm{H}_{2}$, to give hydrogen chloride, HC 1 ? How much $\mathrm{HC1}$ is formed?
9. $\quad 3.65 \mathrm{~g} \mathrm{of}_{\mathrm{H}_{2}}$ and 26.7 g of $\mathrm{O}_{2}$ are mixed and reacted. How many grams of $\mathrm{H}_{2} \mathrm{O}$ are formed?
10. Caustic soda NaOH can be commercially prepared by the reaction of $\mathrm{Na}_{2} \mathrm{CO}_{3}$ with slaked line, $\mathrm{Ca}(\mathrm{OH})_{2}$. How many grams of NaOH can be obtained by treating 2.0 kg of $\mathrm{Na}_{2} \mathrm{CO}_{3}$ with $\mathrm{Ca}(\mathrm{OH})_{2}$ ?
11. A portable hydrogen generator utilizes the reaction
$\mathrm{CaH}_{2}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{Ca}(\mathrm{OH})_{2}+2 \mathrm{H}_{2}$
How many grams of $\mathrm{H}_{2}$ can be produced by a 100 g cartridge of $\mathrm{CaH}_{2}$ ?
$\qquad$

MODULE-1
Atoms, Molecules and ChemicalArithmatics

## Chemistry

12. The reaction $2 \mathrm{Al}+3 \mathrm{MnO} \rightarrow \mathrm{Al}_{2} \mathrm{O}_{3}+3 \mathrm{Mn}$ proceeds till the limiting substance is consumed. A mixture of 220 g Al and 400 g MnO was heated to initiate the reaction. Which initial substance remained in excess and by how much ? $(\mathrm{Al}=27, \mathrm{Mn}=55)$.
$\qquad$
13. $\mathrm{KClO}_{4}$ may be prepared by means of following series of reactions
$\mathrm{Cl}_{2}+2 \mathrm{KOH} \rightarrow \mathrm{KCl}+\mathrm{KClO}+\mathrm{H}_{2} \mathrm{O}$
$3 \mathrm{KClO} \rightarrow 2 \mathrm{KCl}+\mathrm{KClO}_{3}$
$4 \mathrm{KClO}_{3} \rightarrow 3 \mathrm{KClO}_{4}+\mathrm{KCl}$
How much $\mathrm{Cl}_{2}$ is needed to prepare $400 \mathrm{~g} \mathrm{KClO}_{4}$ by the above sequence?
$(\mathrm{K}=39, \mathrm{Cl}=35.5, \mathrm{O}=16, \mathrm{H}=1)$
14. 2.0 g of a mixture of $\mathrm{Na}_{2} \mathrm{CO}_{3}$ and $\mathrm{NaHCO}_{3}$ was heated when its weight reduced to 1.876 g . Determine the percentage composition of the mixture.
15. Calculate the weight of $60 \%$ sulphuric acid required to decompose 150 g of chalk (calcium carbonate). Given $\mathrm{Ca}=40, \mathrm{C}=12, \mathrm{O}=16, \mathrm{~S}=32$ )

## Answers to Intext Questions

## 2.1

(1) Molar mass of $\mathrm{Fe}_{3} \mathrm{O}_{4}=3 \times 56.0+4 \times 16.0$

$$
=(168.0+64.0)=232.0 \mathrm{~g} \mathrm{~mol}^{-1}
$$

Percentage of $\mathrm{Fe} \quad=\frac{168.0}{232.0} \times 100=72.41 \%$
Percentage of $O \quad=\frac{64.0}{232.0} \times 100=27.59 \%$
(2) (a) Molar mass of $\mathrm{SrCO}_{3}=87.6+12.0+48.0=147.6 \mathrm{~g} \mathrm{~mol}^{-1}$

Percentage of carbon C in $\mathrm{SrCO}_{3}=\frac{12.0}{147.6} \times 100=8.13 \%$
(b) Molar mass of $\mathrm{H}_{2} \mathrm{SO}_{4}=2.0+32.1+64.0=98.1 \mathrm{~g} \mathrm{~mol}^{-1}$

Molar mass of $\mathrm{SO}_{3}=32.1+48.0=80.1 \mathrm{~g} \mathrm{~mol}^{-1}$
Percentage of $\mathrm{SO}_{3}$ in $\mathrm{H}_{2} \mathrm{SO}_{4}=\frac{80.1 \times 100}{98.1}=81.65 \%$

Percentage of Oxygen $=46.9 \%$
3. Substance
$\mathrm{H}_{2} \mathrm{O}_{2}$
$\mathrm{C}_{6} \mathrm{H}_{12}$
$\mathrm{Li}_{2} \mathrm{CO}_{3}$
$\mathrm{C}_{2} \mathrm{H}_{4} \mathrm{O}_{2}$
$\mathrm{S}_{8}$
$\mathrm{H}_{2} \mathrm{O}$
$\mathrm{B}_{2} \mathrm{H}_{6}$
$\mathrm{O}_{3}$
$\mathrm{S}_{3} \mathrm{O}_{9}$
$\mathrm{N}_{2} \mathrm{O}_{3}$
4. Percentage of carbon $=53.1 \%$

## Empirical formula

HO
$\mathrm{CH}_{2}$
$\mathrm{Li}_{2} \mathrm{CO}_{3}$
$\mathrm{CH}_{2} \mathrm{O}$
S
$\mathrm{H}_{2} \mathrm{O}$
$\mathrm{BH}_{3}$
$\mathrm{O}_{3}$
$\mathrm{SO}_{3}$
$\mathrm{N}_{2} \mathrm{O}_{3}$

Suppose we take 100 g of the substance then moles of carbon $=\frac{53.1}{12.0} \mathrm{~g}=4.43 \mathrm{~mol}$

$$
\begin{aligned}
\text { mole of oxygen } & =\frac{46.0}{16.0}=2.93 \mathrm{~mol} \\
\text { molar ratio of } \mathrm{C} \text { and } \mathrm{O} & =\frac{4.43}{2.93}: \frac{2.93}{2.93} \\
& =1.50: 1 \text { or } 3: 2
\end{aligned}
$$

Empirical formula of the compound is $\mathrm{C}_{3} \mathrm{O}_{2}$

## 2.2

1. In equation

| $\mathrm{N}_{2}(\mathrm{~g})$ | + | $3 \mathrm{H}_{2}(\mathrm{~g}) \rightarrow$ | $2 \mathrm{NH}_{3}(\mathrm{~g})$ |
| :---: | :---: | :---: | :---: |
| 1 mol |  | 3 mol | 2 mol |

0.207 mol of $\mathrm{N}_{2}$ gives 0.414 mol of $\mathrm{NH}_{3}$ $0.414 \mathrm{~mol}^{\text {of }} \mathrm{NH}_{3}=0.414 \mathrm{~mol} \times 17.0 \mathrm{~g} \mathrm{~mol}^{-1}=7.038 \mathrm{~g} \mathrm{of} \mathrm{NH}_{3}$
22.6 g of hydrogen $=\frac{22.6}{2.0}=11.3 \mathrm{~mol}$ of hydrogen
11.3 mol of hydrogen will give $\frac{2}{3} \times 11.3 \mathrm{~mol}$ of $\mathrm{NH}_{3}=7.53 \mathrm{~mol}$

## MODULE-1

Atoms, Molecules and Chemical Arithmatics

## Chemistry

Therefore, mass of $\mathrm{NH}_{3}=7.53 \mathrm{~mol} \times 17.0 \mathrm{~g} \mathrm{~mol}^{-1}=128.01 \mathrm{~g}$
2. $\quad \mathrm{C}_{2} \mathrm{H}_{4}(\mathrm{~g})+3 \mathrm{O}_{2}(\mathrm{~g})$
$1 \mathrm{~mol} \quad 3 \mathrm{~mol}$
$\rightarrow \quad \underset{\substack{2 \mathrm{~mol}}}{2 \mathrm{CO}_{2}(\mathrm{~g})}$
$+\quad \begin{aligned} & 2 \mathrm{H}_{2} \mathrm{O}(\mathrm{g}) \\ & 2 \mathrm{~mol}\end{aligned}$
(a) $4.16 \times 10^{-2} \mathrm{~mol}$ of $\mathrm{C}_{2} \mathrm{H}_{4}$ will consume $3 \times 4.16 \times 10^{-2} \mathrm{~mol}$ of oxygen

$$
=12.48 \times 10^{-2}=1.248 \times 10^{-1} \mathrm{~mol} \text { of } \mathrm{O}_{2}
$$

(b) moles of $\mathrm{H}_{2} \mathrm{O}$ formed $=2 \times 4.16 \times 10^{-2} \mathrm{~mol}$

$$
=8.32 \times 10^{-2} \mathrm{~mol} \text { of } \mathrm{H}_{2} \mathrm{O}
$$

[^0]:    * Formulae is plural of formula

[^1]:    *Earlier, the standard pressure was taken as 1 atmosphere and the volume of one mole of gas at STP was taken as 22.4 L .
