## MODULE-6

Presentation and Analysis of Data in Economics

Economic data are usually studied with the help of statistical methods. Science of statistics is a method of collection, classification andtabulation of numerical facts, which helpinexplanation, description and comparison of phenomena.

Clearly in singular sense statistics is a scientific subject, which is descriptive as well as conclusive. In descriptive statistics we include a complete gamut of scientific enquiry. In all kinds of statistical enquiry the first step is to gather the facts through various methods. The facts collected from respondents are first edited. These facts are then presented with the help of tables, graphs and diagrams. Quantitative information is statistically analysed. Representative figures are interpreted in the context they have been studied.

## OBJECTIVES

After completing this lesson, you will be able to:

- understand the meaning of the term central tendency;
- use the concept of average in your day-to-day life;
- calculate arithmetic mean of various series;
- use alternate methods to calculate arithmetic mean.

### 18.1 MEANING OF CENTRAL TENDENCY

After the data have been collected, organised and presented they need to be analysed. Analysis of datais atechnique through which significantfact from the numerical dataare extracted. One of the mostimportant objects of statistical analysis is to get one single value that describe the characteristics of the whole data.
In statistics we deal with certain problems, which are largely affected by multiplicity of causes. Whatever conclusions we draw are based on combined effect of the various
causes and it is very difficult to trace outimpact of all such causes separately. However, the first step in data analysis is to ascertain representative values from the raw data. It is known as average or measure of central tendency.

Raw data are first edited and then converted into frequency distribution. One of the basic purposes of descriptive statistics is tofind out a most representative value or figure from the data. This representative figure is called average or mean. This is the value or single figure, which is typical to all. This is also known as measure of central tendency. Thus averages are the descriptive statistics, which measure the tendency called central tendency. It has been well established that there is a tendency of data to move towards aparticulardirection.

Tendency of data to cluster towards the central location or value is called central tendency.

The purpose for computing an average value for a set of data is to obtain a single value which is representative of all the items and which the mind can grasp simply and quickly. The single value is the point around which the individual items cluster.

We often use the term average in our day-to-day discussions. If one claims that his average marks are 76 out of 100 in 6 subjects. It shows that he succeed in total of 456 i.e. $76 \times 06$ marks. Forexample, if actual runs scored by Sachininfive innings in a series are $59,78,100,50$ and 63 he scored 350 runs in total. His average score is $350 / 5=$ 70. It is important to note that Sachin never scored exactly 70 runs in any inning he played. However, on an average this figure is a good representative of his scores in five innings.

The purpose of computing an average value for a set of observations is to obtain a single value which is representative of all the items and which the mind can grasp simply and quickly.

### 18.2 PURPOSE AND FUNCTIONS OF AVERAGES

- to convert the collected information and raw data in brief
- to facilitate comparison between two or more groups
- to present a representative value from raw data
- tofacilitate future policy and programme.

### 18.3 ARITHMETIC MIEAN AS A MEASURE OF CENTRAL TENDENCY

There are various measures of central tendency. Arithmetic mean is one of them
Arithmetic mean is obtained by dividing the sum of the items by the number of items mathematically speaking:

Presentation and Analysis of Data in Economics

$$
\overline{\mathrm{X}}=\frac{\Sigma \mathrm{x}}{\mathrm{~N}}
$$

where,

$$
x=\text { item }
$$

$\Sigma \mathrm{x}=$ sum of the item
$\mathrm{N}=$ Number of items and
$\overline{\mathrm{X}}=$ Arithmetic mean
Arithmetic mean in common language is popularly known as average. It is very easy to calculate it, say for example there are 10 students in a class. They scored marks in economics out of 10 as follows

| Student | A | B | C | D | E | F | G | H | I | J |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Mark | 2 | 7 | 10 | 8 | 6 | 3 | 5 | 4 | 5 | 0 |

Here ' $x$ ' is marks in economics. Let us start with the sum of the $2+7+10+8+6+$ $3+5+4+5+0=50$, clearly 10 students secured 50 marks $(\Sigma x)$ in all. Number of students ( N ) is 10 , the average of the marks scored by 10 students is thus $50 / 10=5$ in other words

$$
\overline{\mathrm{x}}=\frac{\Sigma \mathrm{x}}{\mathrm{~N}}=\frac{50}{10}=5
$$

## INTEXT QUESTIONS 18.1

1. Give an example of central tendency.
2. Give basic formula to calculate arithmetic mean.
3. if sum of items is 40 and mean is 4 find out " $N$ " (number) of items.
4. Weekly consumption of sugar of Mr. Raja is 35 kg what is his average daily consumption?
5. If average marks of 10 students is 50 if one more student is added to group who secured 5 marks. What will be the new average?

### 18.4 CALCULATION OF ARITHMETIC MEAN IN DIFFERENT TYPES OF SERIES

As given in Lesson 17, data can be organized in different types of series. They areIndividual series, Discrete series and Continuous series. Calculation of arithmatic mean for different series of data is given below

## Analysis of Data

A. Individual series:Above formula forcalculation of arithmetic mean ormeanis valid under all circumstances. However, if shortcut method is to be used for complexed data, above formula is modified as follows:

$$
\overline{\mathrm{x}}=\mathrm{A}+\frac{\Sigma \mathrm{dx}}{\mathrm{~N}}
$$

HereAis assumed mean, dx is deviating x from assumed mean andN is number of items.
Illustration 1. Ascertain arithmetic mean from the following marks secured by 10 students out of 30 .

$$
\begin{aligned}
& x: 4,3,8,9,12,10,25,10,21 \text { and } 20 \\
& x=\text { Marks }
\end{aligned}
$$

## Solution

(a) Direct method

$$
\begin{aligned}
& \Sigma \mathrm{x}: 4+3+8+9+12+10+25+10+21+20=122 \\
& \overline{\mathrm{x}}=\frac{\Sigma \mathrm{x}}{\mathrm{~N}}=\frac{122}{10}=12.2
\end{aligned}
$$

(b) Shortcut method

| x marks | $d x=x-\mathrm{A}$ <br> $\mathrm{A}=12=\mathrm{x}-12$ |
| :---: | :---: |
| 4 | -8 |
| 3 | -9 |
| 8 | -4 |
| 9 | -3 |
| 12 | 0 |
| 10 | -2 |
| 25 | +13 |
| 10 | -2 |
| 21 | +9 |
| 20 | +9 |
| $\Sigma 122$ | $\Sigma \mathrm{dx}=2$ |

Let us assume 12 as assumed mean (A)

$$
\begin{aligned}
& \overline{\mathrm{x}}=\mathrm{A}+\frac{\Sigma \mathrm{dx}}{\mathrm{~N}}=12+\frac{2}{10} \\
& \overline{\mathrm{x}}=12+0.2=12.2
\end{aligned}
$$

Presentation and Analysis of Data in Economics

Notes
B. Discrete series: for ascertainment of arithmetic mean in discrete series following formulae can be used
(a) Direct method

$$
\overline{\mathrm{x}}=\frac{\Sigma \mathrm{fdx}}{\mathrm{~N}}
$$

where $\mathrm{N}=$ Sum of frequencies
(b) Shortcut method

$$
\overline{\mathrm{x}}=\mathrm{A}+\frac{\Sigma \mathrm{fdx}}{\mathrm{~N}}
$$

Illustration 2. Calculate arithmetic mean from the data given below:

| Numberof childrenperfamily | 0 | 1 | 2 | 3 | 4 | 5 | 6 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Numberoffamilies | 13 | 17 | 20 | 40 | 20 | 17 | 13 |

## Solution.

(a) Direct method

$$
\begin{aligned}
& x=\text { number of children } \\
& f=\text { number of families }
\end{aligned}
$$

| $x$ | $f$ | $f x$ |
| :---: | :---: | :---: |
| 0 | 13 | 0 |
| 1 | 17 | 17 |
| 2 | 20 | 40 |
| 3 | 40 | 120 |
| 4 | 20 | 80 |
| 5 | 17 | 85 |
| 6 | $\frac{13}{140}$ | $\frac{78}{420}$ |

$$
\overline{\mathrm{x}}=\frac{\sum \mathrm{fx}}{\mathrm{~N}}=\frac{420}{140}=3
$$

Thus, average is 3 , which indicates that there are 3 children per family on an average
(b) Shortcut method

| x | f | $\mathrm{dx}=(\mathrm{x}-\mathrm{A}) \mathrm{A}=2$ | fdx |
| :---: | :---: | :---: | :---: |
| 0 | 13 | -2 | -26 |
| 1 | 17 | -1 | -17 |
| 2 | 20 | 0 | 0 |
| 3 | 40 | +1 | 40 |
| 4 | 20 | +2 | 40 |
| 5 | 17 | +3 | 51 |
| 6 | 13 | +4 | 52 |
| 140 |  | +183 |  |
|  |  |  | -43 |
| 140 |  |  |  |

$$
\overline{\mathrm{x}}=\mathrm{A}+\frac{\Sigma \mathrm{fdx}}{\mathrm{~N}}=2+\frac{140}{140}=3
$$

C. Continuous series: Following three methods are used for ascertainment of arithmetic mean in a continuous series
(a) Direct method

$$
\overline{\mathrm{x}}=\frac{\Sigma \mathrm{fdx}}{\mathrm{~N}}
$$

(b) Shortcut method withoutstep deviation
$x=$ mid value of a class

$$
\overline{\mathrm{x}}=\mathrm{A}+\frac{\Sigma \mathrm{fdx}}{\mathrm{~N}}
$$

(c) Shortcut method with step deviation

$$
\overline{\mathrm{x}}=\mathrm{A}+\frac{\Sigma \mathrm{fdx}^{\prime}}{\mathrm{N}} \times \mathrm{c}
$$

Here $\mathrm{c}=$ common factor
Calculation of arithmetic mean for continuous series is explained indetail below with the help of an example

Presentation and Analysis of Data in Economics

Illustration 3. The marks secured by 300 students in a school

| $x$ (marks) | $0-10$ | $10-20$ | $20-30$ | $30-40$ | $40-50$ | $50-60$ | $60-70$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $f($ no. of students) | 23 | 27 | 40 | 120 | 40 | 27 | 23 |

Solution. First let us calculate mid value for each class. It is done by taking a sum of lower and upper limit of each group and dividing it by 2 i.e.

$$
\begin{aligned}
\mathrm{x}= & \frac{\mathrm{L}_{1}+\mathrm{L}_{2}}{2}, \frac{0+10}{2}, \frac{10+20}{2}, \frac{20+30}{2}, \frac{30+40}{2}, \frac{40+50}{2} \\
& \frac{50+60}{2}, \frac{60+70}{2} \text { i.e. } 5,15,25,35,45,55 \text { and } 65
\end{aligned}
$$

Here $L_{1}$ is lower limit while $L_{2}$ is the upper limit of each class
(a) Direct method

| $x$ | $x=\frac{l_{1}+l_{2}}{2}$ | $f$ | $f x$ |
| :---: | :---: | :---: | :---: |
| $0-10$ | 5 | 23 | 115 |
| $10-20$ | 15 | 27 | 405 |
| $20-30$ | 25 | 40 | 1000 |
| $30-40$ | 35 | 120 | 4200 |
| $40-50$ | 45 | 40 | 1800 |
| $50-60$ | 55 | 27 | 1485 |
| $60-70$ | 65 | 23 | 1495 |
|  |  | 300 | 10500 |

$$
\overline{\mathrm{x}}=\frac{\Sigma \mathrm{fx}}{\mathrm{~N}}=\frac{10500}{300}=35
$$

(b) Shortcut method
(i) Withoutstep deviation

| $x$ | $f$ | $M V(x)$ | $d x(x-A) A-25$ | $f d x$ |
| :---: | :---: | :---: | :---: | :---: |
| $0-10$ | 23 | 5 | -20 | -460 |
| $10-20$ | 27 | 15 | -10 | -270 |
| $20-30$ | 40 | 25 | 0 | 0 |
| $30-40$ | 120 | 35 | +10 | 1200 |
| $40-50$ | 40 | 45 | +20 | 800 |
| $50-60$ | 27 | 55 | +30 | 810 |
| $60-70$ | 23 | 65 | +40 | 920 |
|  | 300 |  |  | 3000 |

$$
\overline{\mathrm{x}}=\mathrm{A}+\frac{\Sigma \mathrm{fdx}}{\mathrm{~N}}=25+\frac{3000}{300}=25+10=35
$$

(c) Shortcut method with step deviation

| x | $\operatorname{Mv}(\mathrm{x})$ | f | $\mathrm{dx}(\mathrm{x}-\mathrm{A}) \mathrm{A}=25$ | $35 \mathrm{dx}_{\mathrm{L}=1}^{1}=\left(\frac{\mathrm{dx}}{10}\right)$ | $\mathrm{fdx}^{1}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $0-10$ | 5 | 23 | -20 | -2 | -46 |
| $10-20$ | 15 | 27 | -10 | -1 | -27 |
| $20-30$ | 25 | 40 | 0 | 0 | 0 |
| $30-40$ | 35 | 120 | +10 | 1 | 120 |
| $40-50$ | 45 | 40 | +20 | +2 | +80 |
| $50-60$ | 55 | 27 | +30 | 3 | 81 |
| $60-70$ | 65 | 23 | +40 | 4 | 92 |
|  |  | 300 |  |  | 300 |

$$
\overline{\mathrm{x}}=\mathrm{A}+\frac{\Sigma \mathrm{fdx}}{\mathrm{~N}} \times \mathrm{c}=25+\frac{300}{300} \times 10=35
$$

### 18.6 PRECAUTIONS OF USING ARITHMETIC MEAN

Let us provide two important precautions while using arithmetic mean.

1. It is important to note that arithmetic mean is a theoretical value, which may not be represented by actual fact. Say for example, if in all there are 27 children in 10 families. Average number of children per family would be $2.7(27 \div 10)$. It is unrealistic. There can be either 2 or 3 children per family but not 2.7 .
2. Arithmetic mean cannot be qualitative data such as honesty, bravery, loyalty and beauty etc.

## INTEXT QUESTIONS 18.2

1. Calculate arithmetic mean from the following data: $4,6,3,7,8,2$ and 5
2. Calculate arithmetic mean from the following data:

| Marks (out of 5) | 0 | 1 | 2 | 3 | 4 | 5 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Number of student | 3 | 7 | 8 | 5 | 3 | 4 |

3. If sum of the deviation measured from assumed mean of a group 10 is +50 and assumed mean is 20 , what will be the actual mean.

## WHAT YOU HAVE LEARNT

- Tendency of data to cluster towards the central location or value is called central tendency.
- An average is a value which is representative of set of data.
- Arithmetic mean is a mathematical average and which is commonly used as a measure of central tendency.
- Arithmetic mean is obtained by dividing the sum of the items by the numberof items mathematically speaking:

$$
\overline{\mathrm{X}}=\frac{\Sigma \mathrm{x}}{\mathrm{~N}}
$$

where, $x=$ item
$\Sigma x=$ sum of the item
$\mathrm{N}=$ Number of items and
$\overline{\mathrm{X}}=$ Arithmetic mean

- Arithmatic mean can be calculated for Individual series, Discrete series and Continuous series by using differnt formulae.

## C- TERMINAL EXERCISE

1. What do you mean by analysis of data?
2. What is meant by descriptive analysis?
3. Discuss the concept of central tendency.
4. What do you mean by arithmetic mean? How is it calculated?
5. Define arithmetic mean. What does itreflect?
6. What do you mean central tendency? How does arithmetic mean reflectit?
7. From the following data find out mean: $7,4,17,19,11,16,15,14,9$ and 11 .
8. If the following items are also added to above set of data, what would be the revised mean $18,14,14,8,10$ and 21
9. Calculate mean from the data given below:

| $x$ | $f$ |
| :---: | :---: |
| 0 | 1 |
| 1 | 13 |
| 2 | 20 |
| 3 | 40 |
| 4 | 40 |
| 5 | 13 |
| 6 | 7 |

10. Calculate arithmetic mean from the data given below:

| $x$ | $f$ |
| :---: | :---: |
| $0-10$ | 5 |
| $10-20$ | 15 |
| $20-30$ | 20 |
| $30-40$ | 25 |
| $40-50$ | 20 |
| $50-60$ | 15 |
| $60-70$ | 5 |

## MODULE-6

Presentation and Analysis of Data in Economics

11. From the data given below find out mean

| $x$ | $f$ |
| :---: | :---: |
| $20-40$ | 2 |
| $40-60$ | 7 |
| $60-80$ | 9 |
| $80-100$ | 24 |
| $100-120$ | 9 |
| $120-140$ | 7 |
| $140-160$ | 2 |
