## MEASURES OF DISPERSION

You have learnt various measures of central tendency. Measures of central tendency help us to represent the entire mass of the data by a single value.
Can the central tendency describe the data fully and adequately?
In order to understand it, let us consider an example.
The daily income of the workers in two factories are :

| Factory A | $:$ | 35 | 45 | 50 | 65 | 70 | 90 | 100 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :---: |
| Factory B | $:$ | 60 | 65 | 65 | 65 | 65 | 65 | 70 |

Here we observe that in both the groups the mean of the data is the same, namely, 65
(i) In group A , the observations are much more scattered from the mean.
(ii) In group B, almost all the observations are concentrated around the mean.

Certainly, the two groups differ even though they have the same mean.
Thus, there arises a need to differentiate between the groups. We need some other measures which concern with the measure of scatteredness (or spread).

To do this, we study what is known as measures of dispersion.

## OBJECTIVES

After studying this lesson, you will be able to :

- explain the meaning of dispersion through examples;
- define various measures of dispersion - range, mean deviation, variance and standard
deviation;
- calculate mean deviation from the mean of raw and grouped data;
- calculate mean deviation from the median of raw and grouped data.
- calculate variance and standard deviation of raw and grouped data; and
- illustrate the properties of variance and standard deviation.
- Analyses the frequencys distributions with equal means.

## EXPECTED BACKGROUND KNOWLEDGE

- Mean of grouped data
- Median of ungrouped data

### 17.1 MEANING OF DISPERSION

To explain the meaning of dispersion, let us consider an example.
17.1 MEANING OF DISPIERSION

Two sections of 10 students each in class $X$ in a certain school were given a common test in Mathematics (maximum marks 40). The scores of the students are given below :
SectionA:
S
Section B:
The average score in section A is 15
The average score in section B is 19. The position of mean is marked by an arrow in the dot diagram.

Section A

П1111111111111111111111111111111

Section B

Fig. 17.1
Clearly, the extent of spread or dispersion of the data is different in section A from that of B. The measurement of the scatter of the given data about the average is said to be a measure of dispersion or scatter.

In this lesson, you will read about the following measures of dispersion :
(a) Range
(b) Mean deviation from mean
(c) Mean deviation from median
(d) Variance
(e) Standard deviation

### 17.2 DEFINITION OF VARIOUS MEASURES OF DISPERSION

(a) Range : In the above cited example, we observe that
(i) the scores of all the students in section A are ranging from 6 to 35;
(ii) the scores of the students in section B are ranging from 15 to 25 .

The difference between the largest and the smallest scores in section A is 29 (35-6)
The difference between the largest and smallest scores in section B is $10(25-15)$.
Thus, the difference between the largest and the smallest value of a data, is termed as the range of the distribution.

## Measures of Dispersion

(b) Mean Deviation from Mean : In Fig. 17.1, we note that the scores in section B cluster around the mean while in section A the scores are spread away from the mean. Let us take the deviation of each observation from the mean and add all such deviations. If the sum is 'large', the dispersion is 'large'. If, however, the sum is 'small' the dispersion is small.
Let us find the sum of deviations from the mean, i.e., 19 for scores in section A.

| Observations $\left(\mathrm{x}_{\mathrm{i}}\right)$ | Deviations from mean $\left(\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right)$ |
| :---: | :---: |
| 6 | -13 |
| 9 | -10 |
| 11 | -8 |
| 13 | -6 |
| 15 | -4 |
| 21 | +2 |
| 23 | +4 |
| 28 | +9 |
| 29 | +10 |
| 35 | 16 |
| 190 | 0 |

MODULE - V
Statistics and Probability

Notes

Here, the sum is zero. It is neither 'large' nor 'small'. Is it a coincidence?
Let us now find the sum of deviations from the mean, i.e., 19 for scores in section B.

| Observations $\left(\mathrm{x}_{\mathrm{i}}\right)$ | Deviations from mean $\left(\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right)$ |
| :---: | :---: |
| 15 | -4 |
| 16 | -3 |
| 16 | -3 |
| 17 | -2 |
| 18 | -1 |
| 19 | 0 |
| 20 | 1 |
| 21 | 2 |
| 23 | 4 |
| 25 | 6 |
| 190 | 0 |

Again, the sum is zero. Certainly it is not a coincidence. In fact, we have proved earlier that the sum of the deviations taken from the mean is always zero for any set of data. Why is the sum always zero?
On close examination, we find that the signs of some deviations are positive and of some other deviations are negative. Perhaps, this is what makes their sum always zero. In both the cases,

MODULE - V
Statistics and Probability

we get sum of deviations to be zero, so, we cannot draw any conclusion from the sum of deviations. But this can be avoided if we take only the absolute value of the deviations and then take their sum.
If we follow this method, we will obtain a measure (descriptor) called the mean deviation from the mean.

The mean deviation is the sum of the absolute values of the deviations from the mean divided by the number of items, (i.e., the sum of the frequencies).
(c) Variance : In the above case, we took the absolute value of the deviations taken from mean to get rid of the negative sign of the deviations. Another method is to square the deviations. Let us, therefore, square the deviations from the mean and then take their sum. If we divide this sumby the number of observations (i.e., the sum of the frequencies), we obtain the average of deviations, which is called variance. Variance is usually denoted by $\sigma^{2}$.
(d) Standard Deviation : If we take the positive square root of the variance, we obtain the root mean square deviation or simply called standard deviation and is denoted by $\sigma$.

### 17.3 MEAN DEVIATION FROM MEAN OF RAW AND

 GROUPED DATAMean Deviation from mean of raw data $=\frac{\sum_{i=1}^{n}\left|x_{i}-\bar{x}\right|}{N}$
Mean deviation from mean of grouped data $=\frac{\sum_{i=1}^{n}\left[f_{i}\left|x_{i}-\bar{x}\right|\right]}{N}$
where $\mathrm{N}=\sum_{\mathrm{i}=1}^{\mathrm{n}} \mathrm{f}_{\mathrm{i}}, \overline{\mathrm{x}}=\frac{1}{\mathrm{~N}} \sum_{\mathrm{i}=1}^{\mathrm{n}}\left(\mathrm{f}_{\mathrm{i}} \mathrm{x}_{\mathrm{i}}\right)$
The following steps are employed to calculate the mean deviation from mean.
Step 1 : Make a column of deviation from the mean, namely $x_{i}-\bar{x}$ (In case of grouped data take $\mathrm{x}_{\mathrm{i}}$ as the mid value of the class.)
Step 2: Take absolute value of each deviation and write in the column headed $\left|x_{i}-\bar{x}\right|$.
For calculating the mean deviation from the mean of raw data use
Mean deviation of Mean $=\frac{\sum_{i=1}^{n}\left|x_{i}-\bar{x}\right|}{N}$
For grouped data proceed to step 3.
Step 3 : Multiply each entry in step 2 by the corresponding frequency. We obtain $f_{i}\left(x_{i}-\bar{x}\right)$ and write in the column headed $f_{i}\left|x_{i}-\bar{x}\right|$.

## Measures of Dispersion

Step 4 : Find the sum of the column in step 3. We obtain $\sum_{i=1}^{n}\left[f_{i}\left|x_{i}-\bar{x}\right|\right]$
Step 5 : Divide the sum obtained in step 4 by N.
Now let us take few examples to explain the above steps.
Example 17.1 Find the mean deviation from the mean of the following data:

| Size of items $\mathrm{x}_{\mathrm{i}}$ | 4 | 6 | 8 | 10 | 12 | 14 | 16 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Frequency $\mathrm{f}_{\mathrm{i}}$ | 2 | 5 | 5 | 3 | 2 | 1 | 4 |

Mean is 10

## Solution :

| $\mathrm{x}_{\mathrm{i}}$ | $\mathrm{f}_{\mathrm{i}}$ | $\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}$ | $\left\|\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right\|$ | $\mathrm{f}_{\mathrm{i}}\left\|\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right\|$ |
| ---: | :---: | :---: | :---: | :---: |
| 4 | 2 | -5.7 | 5.7 | 11.4 |
| 6 | 4 | -3.7 | 3.7 | 14.8 |
| 8 | 5 | -1.7 | 1.7 | 8.5 |
| 10 | 3 | 0.3 | 0.3 | 0.9 |
| 12 | 2 | 2.3 | 2.3 | 4.6 |
| 14 | 1 | 4.3 | 4.3 | 4.3 |
| 16 | 4 | 6.3 | 6.3 | 25.2 |
|  | 21 |  |  | 69.7 |

Mean deviation from mean $=\frac{\sum\left[\mathrm{f}_{\mathrm{i}}\left|\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right|\right]}{21}=\frac{69.7}{21}=3.319$
Example 17.2 Calculate the mean deviation from mean of the following distribution:

| Marks | $0-10$ | $10-20$ | $20-30$ | $30-40$ | $40-50$ |
| :--- | :---: | :---: | :---: | :---: | :---: |
| No. of Students | 5 | 8 | 15 | 16 | 6 |

Mean is 27 marks
Solution :

| Marks | Class Marks $\mathrm{x}_{\mathrm{i}}$ | $\mathrm{f}_{\mathrm{i}}$ | $\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}$ | $\left\|\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right\|$ | $\mathrm{f}_{\mathrm{i}}\left\|\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right\|$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $0-10$ | 5 | 5 | -22 | 22 | 110 |
| $10-20$ | 15 | 8 | -12 | 12 | 96 |
| $20-30$ | 25 | 15 | -2 | 2 | 30 |
| $30-40$ | 35 | 16 | 8 | 8 | 128 |
| $40-50$ | 45 | 6 | 18 | 18 | 108 |
| Total |  | 50 |  |  | 472 |

## MODULE - V

Statistics and
Mean deviation from Mean $=\frac{\sum\left[\mathrm{f}_{\mathrm{i}}\left|\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right|\right]}{\mathrm{N}}=\frac{472}{50}$ Marks $=9.44$ Marks

## CHECK YOUR PROGRESS 17.1

1. The ages of 10 girls are given below :

| 3 | 5 | 7 | 8 | 9 | 10 | 12 | 14 | 17 | 18 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

What is the range ?
2. The weight of 10 students (in Kg ) of class XII are given below :
$\begin{array}{llllllllll}45 & 49 & 55 & 43 & 52 & 40 & 62 & 47 & 61 & 58\end{array}$

What is the range ?
3. Find the mean deviation from mean of the data

| 45 | 55 | 63 | 76 | 67 | 84 | 75 | 48 | 62 | 65 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

Given mean $=64$.
4. Calculate the mean deviation from mean of the following distribution.

| Salary (in rupees) | $20-30$ | $30-40$ | $40-50$ | $50-60$ | $60-70$ | $70-80$ | $80-90$ | $90-100$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| No. of employees | 4 | 6 | 8 | 12 | 7 | 6 | 4 | 3 |

Given mean = Rs. 57.2
5. Calculate the mean deviation for the following data of marks obtained by 40 students in a test

| Marks obtained | 20 | 30 | 40 | 50 | 60 | 70 | 80 | 90 | 100 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| No. of students | 2 | 4 | 8 | 10 | 8 | 4 | 2 | 1 | 1 |

6. The data below presents the earnings of 50 workers of a factory

| Earnings (in rupees) | 1200 | 1300 | 1400 | 1500 | 1600 | 1800 | 2000 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| No. of workers | 4 | 6 | 15 | 12 | 7 | 4 | 2 |

Find mean deviation.
7. The distribution of weight of 100 students is given below :

| Weight (in Kg) | $50-55$ | $55-60$ | $60-65$ | $65-70$ | $70-75$ | $75-80$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| No. of students | 5 | 13 | 35 | 25 | 17 | 5 |

Calculate the mean deviation.

## Measures of Dispersion

8. The marks of 50 students in a particular test are :

| Marks | $20-30$ | $30-40$ | $40-50$ | $50-60$ | $60-70$ | $70-80$ | $80-90$ | $90-100$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| No. of students | 4 | 6 | 9 | 12 | 8 | 6 | 4 | 1 |

Find the mean deviation for the above data.

### 17.4 MEDIAN

### 17.4.1 MEDIAN OF GROUPED DATA

## Median of Discrete Frequency Distribution :

Step 1 : Arrange the data in ascending order.
Step 2 : Find cumulative frequencies
Step 3 : Find $\frac{N}{2}$
Step 4 : The observation whose cumulative frequency is just greater than $\frac{N}{2}$ is the median of the data.

Example 17.3 Find the median of the data

| $x_{i}$ | 8 | 9 | 10 | 12 | 14 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $f_{i}$ | 6 | 2 | 2 | 2 | 6 | 8 |

Solution : The given data are already in ascending order. Let us now write the cumulative frequencies of observations

| $x_{i}$ | 8 | 9 | 10 | 12 | 14 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $f_{i}$ | 6 | 2 | 2 | 2 | 6 | 8 |
| c.f. | 6 | 8 | 10 | 12 | 18 | 26 |

$$
\mathrm{N}=26, \quad \therefore \frac{\mathrm{~N}}{2}=13
$$

The observation whose c.f. is just greater than 13 is 14 (whose c.f. is 18)
$\therefore \quad$ Median $=14$.

### 17.4.2 MEDIAN OF CONTINUOUS FREQUENCY DISTRIBUTION

Step 1 : Arrange the data in ascending order
Step 2 : Write cumulative frequencies of the observations
Step 3 : Identify the class whose cumulative frequency is just greater than $\frac{\mathrm{N}}{2}$. Call this classinterval as median class.

MODULE - V
Statistics and Probability

Step 4 : Find median by the formula
Median $=l+\frac{\frac{N}{2}-C}{f} \times i$
Where
$l \rightarrow$ Lower limit of the median class
$N \rightarrow$ Number of observations $\mathrm{N}=\Sigma f_{i}$
$C \rightarrow$ Cumulative frequency of the class just preceding the median class
$f \rightarrow$ Frequency of the median class
$i \rightarrow$ Width of the median class
Example 17.4 Find the median marks obtained by 50 students from the following distribution :

| Marks | $0-10$ | $10-20$ | $20-30$ | $30-40$ | $40-50$ |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Number of Students | 8 | 8 | 14 | 16 | 4 |

Solution : The given intervals are already in ascending order. The following table has the row corresponding to the cumulative frequencies.

| Marks | $0-10$ | $10-20$ | $20-30$ | $30-40$ | $40-50$ |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Number of students | 8 | 8 | 14 | 16 | 4 |
| Cummulative frequency | 8 | 16 | 30 | 46 | 50 |

$$
\mathrm{N}=50, \frac{N}{2}=25
$$

The class corresponding to the c.f. just greater than 25 is 20-30.
$\therefore \quad$ Median class is $20-30$
where $l=20, \mathrm{~N}=50, \mathrm{C}=16, f=14, i=10$.

$$
\begin{aligned}
\therefore \quad \text { Median } & =l+\frac{\frac{N}{2}-C}{f} \times i=20+\frac{25-16}{14} \times 10 \\
& =20+\frac{9}{14} \times 10=20+6.43=26.43
\end{aligned}
$$

Example 17.5 Find the median of the following:

| Marks | Number of Students |
| :---: | :---: |
| $0-9$ | 3 |
| $10-19$ | 5 |
| $20-29$ | 8 |
| $30-39$ | 9 |
| $40-49$ | 13 |
| $50-59$ | 6 |

## Measures of Dispersion

Solution : The given class intervals are inclusive series Before finding the median we have to convert the inclusive series into exclusive series.

Method of converting an inclusive series into exclusive series.
(1) Find the half of the difference between the upper limit of a class and the lower limit of its succeeding (next) class.
(2) Subtract this half from the lower limit and add into the upper limit.

| Mark | Exclusive Series | f. | c.f. |
| :---: | :---: | :---: | :---: |
| $0-9$ | $0.5-9.5$ | 3 | 3 |
| $10-19$ | $9.5-19.5$ | 5 | 8 |
| $20-29$ | $19.5-29.5$ | 8 | 16 |
| $30-39$ | $\underline{29.5-39.5}$ | 9 | $\underline{25}$ |
| $40-49$ | $39.5-49.5$ | 13 | 38 |
| $50-59$ | $49.5-59.5$ | 6 | 44 |

$$
\frac{N}{2}=\frac{44}{2}=22
$$

$\therefore \quad$ Median class is $29.5-39.5$ as its c.f. is 25 , which is just greater than 22 .
Now, $l=29.5, \mathrm{~N}=44, \mathrm{C}=16, \mathrm{f}=9, i=39.5-29.5=10$
$\therefore \quad$ Median $=l+\frac{\frac{N}{2}-C}{f} \times i=29.5+\frac{22-16}{9} \times 10$
$=29.5+\frac{6}{9} \times 10=29.5+\frac{20}{3}$
$=29.5+6.66=36.16$

## CHECK YOUR PROGRESS 17.2

Find the median of the following data :
1.

| $x_{i}$ | 6 | 11 | 16 | 21 | 26 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $f_{i}$ | 5 | 3 | 6 | 4 | 7 |
| $x_{i}$ | 5 | 10 | 15 | 20 | 25 |
| $f_{i}$ | 5 | 25 | 29 | 17 | 9 |

3. 

| Marks | $0-5$ | $5-10$ | $10-15$ | $15-20$ | $20-25$ |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Number of Boys | 5 | 9 | 10 | 14 | 12 |

We know that for observations in data the central tendency give us the values about which the data concentrate or cluster. It is also essential to know that how far all observation are, from a measure of central tendency. In other words, in data it is required to know how dispersed the observations are from a given point (or a measure of central tendency). In most of the cases mean deviation from mean and median give us the desired disperson or deviation of the observations. Recall that mean deviation for data is defined as the mean of the absolute values of deviations from ' $a$ '.

Recall that the deviation of an observation $x$ from a fixed point ' $a$ ' is the difference $x$ $-a$.

So mean deviation about 'a' denoted by M.D (a) is given by
M.D. $(a)=\frac{\text { Sum of the absolute values of deviations from 'a' }}{\text { Number of observations }}$

Methematically we can write

$$
\text { M.D. }(a)=\frac{\sum_{i=1}^{n}\left|x_{i}-a\right|}{n}
$$

Like wise
M.D. (Mean $=\overline{\mathrm{X}})=\frac{\sum_{i=1}^{n}\left|x_{i}-\bar{x}\right|}{n}$
and

$$
\text { M.D.(Median } \mathrm{M})=\frac{1}{n} \sum_{i=1}^{n}\left|x_{i}-\mathrm{M}\right|
$$

Example 17.6 Find mean deviation about median for the observation
$7,10,15,16,8,9,5,17,14$
Solution : In order to find median, arrange the given values in ascending order, so we have $5,7,8,9,10,14,15,16,17$,

Algorithm to find mean deviation about mean/median :
Step 1 : Calculate the mean or median of the data
Step 2 : Find deviations of each observation $x_{i}$ from mean/median
Step 3 : Find the absolute values of the deviations.
Assolute values can be obtained by dropping the minus sign if it is there
Step 4 : Calculate the mean of the obsolute values of the deviations. This mean will be the required Mean deviation.

$$
n=9,
$$

Median $=\frac{n+1}{2}$ th observation
$=5$ th observation
$\mathrm{M}=10$.
Deviations of the observation from median i.e. 10 are

$$
\begin{array}{cccccccccc} 
& 5-10 & 7-10 & 8-10 & 9-10 & 10-10 & 14-10 & 15-10 & 16-10 & 17-10 \\
\text { i.e } x_{i} \text { - } \mathrm{M} \text { are } & -5 & -3 & -2 & -1 & 0 & 4 & 5 & 6 & 7
\end{array}
$$

Absolute values of the deviations i.e. $\left|x_{i}-\mathrm{M}\right|$ are
$5,3,2,1,0,4,5,6,7$

Now

$$
\begin{aligned}
& \text { M.D. }(\mathrm{M})=\frac{\sum_{i=1}^{n}\left|x_{i}-\mathrm{M}\right|}{n} \\
& =\frac{5+3+2+1+0+4+5+6+7}{10}=\frac{33}{10}=3.3 .
\end{aligned}
$$

### 17.5.1 MEAN DEVIATION OF GROUPED DATA FROM MEDIAN

Recall that data presented in the following form are called grouped data
(a) Discrete frequency distribution

| Observation | $:$ | $x_{1}$ | $x_{2}$ | $x_{3}$ | $\cdots$ | $x_{n}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Frequencies | $:$ | $f_{1}$ | $f_{2}$ | $f_{3}$ | $\cdots$ | $f_{n}$ |

(b) Continuous frequency distribution:

| Observations | $l_{1}-u_{1}$ | $l_{2}-u_{2}$ | $l_{3}-u_{3}$ | $\cdots$ | $l_{n}-u_{n}$ |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Frequencies | $f_{1}$ | $f_{2}$ | $f_{3}$ | $\cdots$ | $f_{n}$ |

For example, marks obtained by 50 students

| Marks | $0-5$ | $5-10$ | $10-15$ | $15-20$ | $20-25$ | $25-30$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Number of Students | 8 | 6 | 12 | 10 | 10 | 4 |

Let us now learn to find mean deviation about median by following examples.
Example 17.7 Find the mean deviation about the median for the following data :

| $x_{i}$ | 25 | 20 | 15 | 10 | 5 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $f_{i}$ | 7 | 4 | 6 | 3 | 5 |
| c.f. | 7 | 11 | 17 | 20 | 25 |

MODULE - V
Statistics and Probability

Here $\mathrm{N}=25$, and we know that median is the $\frac{25+1}{2}=13$ th observation. This observation lies in the C.f 17 , for which corresponding observation is 15 .

$$
\therefore \quad \text { Median } M=15
$$

Now deviations and their absolute values are given in following table.

| $x_{i}$ | $f_{i}$ | $x_{i}-\mathrm{M}$ | $\left\|x_{i}-\mathrm{M}\right\|$ | $f_{i}\left\|x_{i}-\mathrm{M}\right\|$ |
| :---: | :---: | :---: | :---: | :---: |
| 25 | 7 | $25-15=10$ | 10 | $7 \times 10=70$ |
| 20 | 4 | $20-15=5$ | 5 | $4 \times 5=20$ |
| 15 | 6 | $15-15=0$ | 0 | $6 \times 0=0$ |
| 10 | 3 | $10-15=-5$ | 5 | $3 \times 5=15$ |
| 5 | 5 | $5-15=-10$ | 10 | $5 \times 10=50$ |
|  | $\mathrm{~N}=\Sigma f_{i}=25$ |  |  | $\Sigma f_{i}\left\|x_{i}-M\right\|=155$ |

$$
\therefore \quad \text { Mean Deviation }(\mathrm{M})=\frac{\sum_{i=1}^{n} f_{i}\left|x_{i}-M\right|}{\sum_{i=1}^{n} f_{i}}=\frac{155}{25}=6.2
$$

Example 17.8 Find the mean deviation about median for the following data :

| Heights (in cm) | $95-105$ | $105-115$ | $115-125$ | $125-135$ | $135-145$ | $145-155$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Number of Girls | 9 | 15 | 23 | 30 | 13 | 10 |

Solution : Let us first find median :

| Height (in cm) | Number of Girls (f) | Cumulative frequncy (c.f) |
| :---: | :---: | :---: |
| $95-105$ | 9 | 9 |
| $105-115$ | 15 | 24 |
| $115-125$ | 23 | 47 |
| $125-135$ | 30 | 77 |
| $135-145$ | 13 | 90 |
| $145-155$ | 10 | 100 |

$\mathrm{N}=100 \Rightarrow \frac{N+1}{2}=\frac{101}{2}=50.5$
$\frac{N}{2}=50.5$ lies in c.f. 77 .
$\therefore \quad$ Median class is corresponding to the c.f. 77 i.e., $125-135$

where $\quad l=$ lower limit of the median class
$\mathrm{N}=$ sum of frequencies
$\mathrm{C}=$ c.f. of the class just preceding the median class
$\mathrm{f}=$ frequency of the median class
and
$\mathrm{i}=$ width or class-size of the median class
Here, $l=125, \mathrm{~N}=100, \mathrm{C}=47, \mathrm{f}=30, \mathrm{i}=10$
$\therefore \quad \mathrm{M}=125+\frac{50-47}{30} \times 10=125+\frac{3}{3}=126$
To find mean deviation let us form the following table :

| Height <br> (in cm) | Number of <br> Girls <br> (f) | Mid-value <br> of the heights | Absolute <br> Deviation <br> $\left(x_{i}-\mathrm{M} \mid\right)$ | $f_{i}\left\|x_{i}-\mathrm{M}\right\|$ |
| :---: | :---: | :---: | ---: | ---: |
| $95-105$ | 9 | 100 | $\|100-126\|=26$ | $9 \times 26=234$ |
| $105-115$ | 15 | 110 | $\|110-126\|=16$ | $15 \times 16=240$ |
| $115-125$ | 23 | 120 | $\|120-126\|=6$ | $23 \times 6=138$ |
| $125-135$ | 30 | 130 | $\|130-126\|=4$ | $30 \times 4=120$ |
| $135-145$ | 13 | 140 | $\|140-126\|=14$ | $13 \times 14=182$ |
| $145-155$ | 10 | 150 | $\|150-126\|=24$ | $10 \times 24=240$ |
|  | $\Sigma f_{i}=100$ |  |  | $\Sigma f_{i}\|\mathrm{xi}-\mathrm{M}\|=1154$ |

Step 1 : Arrange the intervals in ascending order
Step 2 : Write cumulative frequencies

$$
\begin{aligned}
& \therefore \quad \text { Mean Deviation (Median) }=\text { M.D. }(\mathrm{M})=\frac{\sum_{i=1}^{n} f_{i}\left|x_{i}-M\right|}{\sum_{i=1}^{n} f_{i}}=\frac{1154}{100}=11.54 . \\
& \text { 17.5.2 STEP TO FIND MEAN DEVIATION FROM MEDIAN OF } \\
& \text { A CONTINUOUS FREQUENCY DISTRIBUTION. }
\end{aligned}
$$

MODULE - V
Statistics and Probability

Notes

Step 3 : Identify the median class, as the class having c.f. just greater than $\frac{N}{2}$, where N is the total number of obsservations (i.e. sum of all frequencies)
Step 4 : Find the corresponding values for the median class and put in the formula :

$$
\begin{aligned}
& \text { where } \quad \begin{aligned}
l & \rightarrow \text { lower limit of the madian class } \\
N & \rightarrow \text { Sum of frequencies } \\
C & \rightarrow \text { c.f. of the class just preceding the median class } \\
f & \rightarrow \text { frequency of the median class } \\
i & \rightarrow \text { width of the median class }
\end{aligned}
\end{aligned}
$$

Step 5 : Now form the table for following columns :

| Given intervals | Frequencies | Mid-value <br> $x_{i}$ | Absolute <br> Deviation from <br> Median $\left.\mid x_{i}-\mathrm{M}\right)$ | $f_{i}\left\|x_{i}-\mathrm{M}\right\|$ |
| :--- | :---: | :---: | :---: | :---: |

Step 6 : Now calculate

$$
\text { M.D. }(\mathbf{M})=\frac{\sum_{i=1}^{n} f_{i}\left|x_{i}-M\right|}{\sum_{i=1}^{n} f_{i}}
$$

## CHECK YOUR PROGRESS 17.3

Find the mean deviation about median of the following data.
1.

| $x_{i}$ | 11 | 12 | 13 | 14 | 16 | 17 | 18 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $f_{i}$ | 2 | 3 | 2 | 3 | 1 | 2 | 1 |

2. 

| $x_{i}$ | 3 | 6 | 7 | 9 | 11 | 13 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $f_{i}$ | 3 | 9 | 11 | 8 | 9 | 6 |

3. 

| Weight (in kg) | $40-42$ | $42-44$ | $44-46$ | $46-48$ | $48-50$ |
| :--- | :---: | :---: | :---: | :---: | :---: |
| No. of Students | 9 | 13 | 24 | 28 | 6 |

## Measures of Dispersion

4. 

| Age (in years) | $0-1$ | $1-2$ | $2-3$ | $3-4$ | $4-5$ |
| :--- | :--- | :---: | :---: | :---: | :---: |
| No. of Children <br> given polio drops | 100 | 155 | 210 | 315 | 65 |

### 17.6 VARIANCE AND STANDARD DEVIATION OF RAW DATA

If there are $n$ observations, $x_{1}, x_{2} \ldots, x_{n}$, then
$\operatorname{Variance}\left(\sigma^{2}\right)=\frac{\left(x_{1}-\bar{x}\right)^{2}+\left(x_{2}-\bar{x}\right)^{2}+\ldots . .+\left(x_{n}-\bar{x}\right)^{2}}{n}$
or

$$
\sigma^{2}=\frac{\sum_{i=1}^{n}\left(x_{i}-\bar{x}\right)^{2}}{n} ; \text { where } \bar{x}=\frac{\sum_{i=1}^{n} x_{i}}{n}
$$

The standard deviation, denoted by $\sigma$, is the positive square root of $\sigma^{2}$. Thus

$$
\sigma=+\sqrt{\frac{\sum_{i=1}^{n}\left(x_{i}-\bar{x}\right)^{2}}{n}}
$$

The following steps are employed to calculate the variance and hence the standard deviation of raw data. The mean is assumed to have been calculated already.

Step 1 : Make a column of deviations from the mean, namely, $x_{i}-\bar{x}$.
Step 2 (check) : Sum of deviations from mean must be zero, i.e., $\sum_{i=1}^{n}\left(x_{i}-\bar{x}\right)=0$
Step 3: Square each deviation and write in the column headed $\left(x_{i}-\bar{x}\right)^{2}$.
Step 4 : Find the sum of the column in step 3.
Step 5 : Divide the sum obtained in step 4 by the number of observations. We obtain $\sigma^{2}$.
Step 6: Take the positive square root of $\sigma^{2}$. We obtain $\sigma$ (Standard deviation).
Example 17.9 The daily sale of sugar in a certain grocery shop is given below :

| Monday | Tuesday | Wednesday | Thursday | Friday | Saturday |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 75 kg | 120 kg | 12 kg | 50 kg | 70.5 kg | 140.5 kg |

The average daily sale is 78 Kg . Calculate the variance and the standard deviation of the above data.

## MODULE - V

Statistics and
Probability

Solution : $\overline{\mathrm{x}}=78 \mathrm{~kg}$ (Given)

| $\mathrm{x}_{\mathrm{i}}$ | $\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}$ | $\left(\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right)^{2}$ |
| ---: | :---: | :---: |
| 75 | -3 | 9 |
| 120 | 42 | 1764 |
| 12 | -66 | 4356 |
| 50 | -28 | 784 |
| 70.5 | -7.5 | 56.25 |
| 140.5 | 62.5 | 3906.25 |
|  | 0 | 10875.50 |

Thus $\quad \sigma^{2}=\frac{\sum_{i=1}\left(x_{i}-\bar{x}\right)^{2}}{n}=\frac{10875.50}{6}=1812.58$ (approx.)
and $\quad \sigma=42.57$ (approx.)
Example 17.10 The marks of 10 students of section $A$ in a test in English are given below :

$$
\begin{array}{llllllllll}
7 & 10 & 12 & 13 & 15 & 20 & 21 & 28 & 29 & 35
\end{array}
$$

Determine the variance and the standard deviation.
Solution : Here $\overline{\mathrm{x}}=\frac{\sum \mathrm{x}_{\mathrm{i}}}{10}=\frac{190}{10}=19$

| $\mathrm{x}_{\mathrm{i}}$ | $\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}$ | $\left(\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right)^{2}$ |
| :---: | :---: | :---: |
| 7 | -12 | 144 |
| 10 | -9 | 81 |
| 12 | -7 | 49 |
| 13 | -6 | 36 |
| 15 | -4 | 16 |
| 20 | +1 | 1 |
| 21 | +2 | 4 |
| 28 | +9 | 81 |
| 29 | +10 | 100 |
| 35 | +16 | 256 |
|  | 0 | 768 |

Thus $\quad \sigma^{2}=\frac{768}{10}=76.8$ and $\sigma=+\sqrt{76.8}=8.76$ (approx)

## CHECK YOUR PROGRESS 17.4

1. The salary of 10 employees (in rupees) in a factory (per day) is

| 50 | 60 | 65 | 70 | 80 | 45 | 75 | 90 | 95 | 100 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

Calculate the variance and standard deviation.
2. The marks of 10 students of class $X$ in a test in English are given below :
$\begin{array}{llllllllll}9 & 10 & 15 & 16 & 18 & 20 & 25 & 30 & 32 & 35\end{array}$

Determine the variance and the standard deviation.
3. The data on relative humidity (in \%) for the first ten days of a month in a city are given below:

| 90 | 97 | 92 | 95 | 93 | 95 | 85 | 83 | 85 | 75 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

Calculate the variance and standard deviation for the above data.
4. Find the standard deviation for the data
$\begin{array}{lllllll}4 & 6 & 8 & 10 & 12 & 14 & 16\end{array}$
5. Find the variance and the standard deviation for the data
$\begin{array}{lllllll}4 & 7 & 9 & 10 & 11 & 13 & 16\end{array}$
6. Find the standard deviation for the data.
$\begin{array}{llllllllllllllll}40 & 40 & 40 & 60 & 65 & 65 & 70 & 70 & 75 & 75 & 75 & 80 & 85 & 90 & 90 & 100\end{array}$

## 17. 7 STANDARD DEVIATION AND VARIANCE OF RAW DATA AN ALTERNATE METHOD

If $\bar{x}$ is in decimals, taking deviations from $\bar{x}$ and squaring each deviation involves even more decimals and the computation becomes tedious. We give below an alternative formula for computing $\sigma^{2}$. In this formula, we by pass the calculation of $\bar{x}$.
We know $\quad \sigma^{2}=\sum_{i=1}^{n} \frac{\left(x_{i}-\bar{x}\right)^{2}}{n}=\sum_{i=1}^{n} \frac{x_{i}^{2}-2 x_{i} \bar{x}+\bar{x}^{2}}{n}$

$$
\sigma^{2}=\sum_{i=1}^{n} \frac{\left(x_{i}-\bar{x}\right)^{2}}{n}=\sum_{i=1}^{n} \frac{x_{i}^{2}-2 x_{i} \bar{x}+\bar{x}^{2}}{n}
$$

$$
=\frac{\sum_{i=1}^{n} \mathrm{x}_{\mathrm{i}}^{2}}{\mathrm{n}}-\frac{2 \overline{\mathrm{x}} \sum_{\mathrm{i}=1}^{\mathrm{n}} \mathrm{x}_{\mathrm{i}}}{\mathrm{n}}+\overline{\mathrm{x}}^{2}=\frac{\sum_{\mathrm{i}=1}^{\mathrm{n}} \mathrm{x}_{\mathrm{i}}^{2}}{\mathrm{n}}-\overline{\mathrm{x}}^{2},\left(\because \overline{\mathrm{x}}=\frac{\sum \mathrm{x}_{\mathrm{i}}}{\mathrm{n}}\right)
$$

i.e.

$$
\sigma^{2}=\frac{\sum_{i=1}^{n} x_{i}^{2}-\frac{\left(\sum_{i=1}^{n} x_{i}\right)^{2}}{n}}{n}
$$

## MODULE - V

Statistics and Probability

$$
\sigma=+\sqrt{\sigma^{2}}
$$

The steps to be employed in calculation of $\sigma^{2}$ and, hence $\sigma$ by this method are as follows:
Step 1: Make a column of squares of observations i.e. $x_{i}{ }^{2}$.
Step 2 : Find the sum of the column in step 1. We obtain $\sum_{i=1}^{n} x_{i}^{2}$
Step 3: Substitute the values of $\sum_{i=1}^{n} x_{i}^{2}$, $n$ and $\sum_{i=1}^{n} x_{i}$ in the above formula. We obtain $\sigma^{2}$.
Step 4 : Take the positive sauare root of $\sigma^{2}$. We obtain $\sigma$.
Example 17.11 We refer to Example 17.10 of this lesson and re-calculate the variance and standard deviation by this method.

Solution :

| $\mathrm{x}_{\mathrm{i}}$ | $\mathrm{x}_{\mathrm{i}}{ }^{2}$ |
| ---: | :---: |
| 7 | 49 |
| 10 | 100 |
| 12 | 144 |
| 13 | 169 |
| 15 | 225 |
| 20 | 400 |
| 21 | 441 |
| 28 | 784 |
| 29 | 841 |
| 35 | 1225 |
| 190 | 4378 |

$$
\begin{aligned}
& \sigma^{2}=\frac{\sum_{i=1}^{n} x_{i}^{2}-\frac{\left(\sum_{i=1}^{n} x_{i}\right)^{2}}{n}}{n} \\
& =\frac{4378-\frac{(190)^{2}}{10}}{10} \\
& =\frac{4378-3610}{10}=\frac{768}{10}=76.8
\end{aligned}
$$

## Measures of Dispersion

and

$$
\sigma=+\sqrt{76.8}=8.76 \text { (approx) }
$$

We observe that we get the same value of $\sigma^{2}$ and $\sigma$ by either methods.

### 17.8 STANDARD DEVIATION AND VARIANCE OF GROUPED DATA : METHOD - I

We are given k classes and their corresponding frequencies. We will denote the variance and the standard deviation of grouped data by $\sigma_{g}^{2}$ and $\sigma_{g}$ respectively. The formulae are given below :

$$
\sigma_{g}^{2}=\frac{\sum_{i=1}^{K}\left[\mathrm{f}_{\mathrm{i}}\left(\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right)^{2}\right]}{\mathrm{N}}, \mathrm{~N}=\sum_{\mathrm{i}=1}^{\mathrm{K}} \mathrm{f}_{\mathrm{i}} \text { and } \sigma_{\mathrm{g}}=+\sqrt{\sigma_{\mathrm{g}}^{2}}
$$

The following steps are employed to calculate $\sigma_{g}^{2}$ and, hence $\sigma_{g}$ : (The mean is assumed to have been calculated already).

Step 1: Make a column of class marks of the given classes, namely $\mathrm{x}_{\mathrm{i}}$

Step 2 : Make a column of deviations of class marks from the mean, namely, $x_{i}-\bar{x}$. Of course the sum of these deviations need not be zero, since $x_{i}{ }^{\prime} s$ are no more the original observations.

Step 3 : Make a column of squares of deviations obtained in step 2, i.e., $\left(x_{i}-\bar{x}\right)^{2}$ and write in the column headed by $\left(x_{i}-\bar{x}\right)^{2}$.

Step 4 : Multiply each entry in step 3 by the corresponding frequency.
We obtain $\mathrm{f}_{\mathrm{i}}\left(\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right)^{2}$.

Step 5: Find the sum of the column in step 4. We obtain $\sum_{i=1}^{k}\left[f_{i}\left(x_{i}-\bar{x}\right)^{2}\right]$

Step 6 : Divide the sum obtained in step 5 by $N$ (total no. of frequencies). We obtain $\sigma_{g}^{2}$.
Step 7: $\quad \sigma_{g}=+\sqrt{\sigma_{g}^{2}}$
Example 17.12 In a study to test the effectiveness of a new variety of wheat, an experiment was performed with 50 experimental fields and the following results were obtained :

| Yield per Hectare <br> (inquintals) | Number of Fields |
| :---: | :---: |
| $31-35$ | 2 |
| $36-40$ | 3 |
| $41-45$ | 8 |
| $46-50$ | 12 |
| $51-55$ | 16 |
| $56-60$ | 5 |
| $61-65$ | 2 |
| $66-70$ | 2 |

The mean yield per hectare is 50 quintals. Determine the variance and the standard deviation of the above distribution.

Solution :

| Yield per Hectare <br> (inquintal) | No. of <br> Fields | Class <br> Marks | $\left(x_{i}-\bar{x}\right)$ | $\left(x_{i}-\overline{\mathrm{x}}\right)^{2}$ | $\mathrm{f}_{\mathrm{i}}\left(\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right)^{2}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $31-35$ | 2 | 33 | -17 | 289 | 578 |
| $36-40$ | 3 | 38 | -12 | 144 | 432 |
| $41-45$ | 8 | 43 | -7 | 49 | 392 |
| $46-50$ | 12 | 48 | -2 | 4 | 48 |
| $51-55$ | 16 | 53 | +3 | 9 | 144 |
| $56-60$ | 5 | 58 | +8 | 64 | 320 |
| $61-65$ | 2 | 63 | +13 | 169 | 338 |
| $66-70$ | 2 | 68 | +18 | 324 | 648 |
| Total | 50 |  |  |  | 2900 |

Thus $\quad \sigma_{\mathrm{g}}^{2}=\frac{\sum_{\mathrm{i}=1}^{\mathrm{n}}\left[\mathrm{f}_{\mathrm{i}}\left(\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right)^{2}\right]}{\mathrm{N}}=\frac{2900}{50}=58$ and $\sigma_{\mathrm{g}}=+\sqrt{58}=7.61$ (approx)

### 17.9 STANDARD DEVIATION AND VARIANCE OF GROUPED DATA : -METHOD - II

If $\bar{x}$ is not given or if $\bar{x}$ is in decimals in which case the calculations become rather tedious, we employ the alternative formula for the calculation of $\sigma_{\mathrm{g}}^{2}$ as given below:

$$
\sigma_{\mathrm{g}}^{2}=\frac{\sum_{\mathrm{i}=1}^{\mathrm{k}}\left[\mathrm{f}_{\mathrm{i}} \mathrm{x}_{\mathrm{i}}^{2}\right]-\frac{\left(\sum_{\mathrm{i}=1}^{\mathrm{k}}\left[\mathrm{f}_{\mathrm{i}} \mathrm{x}_{\mathrm{i}}\right]\right)^{2}}{\mathrm{~N}}}{\mathrm{~N}}, \quad \mathrm{~N}=\sum_{\mathrm{i}=1}^{\mathrm{k}} \mathrm{f}_{\mathrm{i}}
$$

## Measures of Dispersion

and

$$
\sigma_{\mathrm{g}}=+\sqrt{\sigma_{\mathrm{g}}^{2}}
$$

The following steps are employed in calculating $\sigma_{\mathrm{g}}^{2}$, and, hence $\sigma_{\mathrm{g}}$ by this method:
Step 1: Make a column of class marks of the given classes, namely, $x_{i}$.
Step 2: Find the product of each class mark with the corresponding frequency. Write the product in the column $\mathrm{x}_{\mathrm{i}} \mathrm{f}_{\mathrm{i}}$.

Step 3: Sum the entries obtained in step 2. We obtain $\sum_{i=1}^{k}\left(f_{i} x_{i}\right)$.
Step 4 : Make a column of squares of the class marks of the given classes, namely, $x_{i}^{2}$.
Step 5 : Find the product of each entry in step 4 with the corresponding frequency. We obtain $\mathrm{f}_{\mathrm{i}} \mathrm{x}_{\mathrm{i}}{ }^{2}$.

Step 6: Find the sum of the entries obtained in step 5. We obtain $\sum_{i=1}^{k}\left(f_{i} x_{i}^{2}\right)$.
Step 7: Substitute the values of $\sum_{i=1}^{k}\left(f_{i} x_{i}^{2}\right), N$ and $\left(\sum_{i=1}^{k}\left(f_{i} x_{i}\right)\right)$ in the formula and obtain $\sigma_{\mathrm{g}}^{2}$.

Step 8: $\quad \sigma_{\mathrm{g}}=+\sqrt{\sigma_{\mathrm{g}}^{2}}$.
Example 17.13 Determine the variance and standard deviation for the data given in Example 17.12 by this method.

Solution :

| Yields per Hectare <br> (in quintals) | $\mathrm{f}_{\mathrm{i}}$ | $\mathrm{x}_{\mathrm{i}}$ | $\mathrm{f}_{\mathrm{i}} \mathrm{x}_{\mathrm{i}}$ | $\mathrm{x}_{\mathrm{i}}{ }^{2}$ | $\mathrm{f}_{\mathrm{i}} \mathrm{x}_{\mathrm{i}}{ }^{2}$ |
| :---: | ---: | ---: | ---: | ---: | ---: |
| $31-35$ | 2 | 33 | 66 | 1089 | 2178 |
| $36-40$ | 3 | 38 | 114 | 1444 | 4332 |
| $41-45$ | 8 | 43 | 344 | 1849 | 14792 |
| $46-50$ | 12 | 48 | 576 | 2304 | 27648 |
| $51-55$ | 16 | 53 | 848 | 2809 | 44944 |
| $56-60$ | 5 | 58 | 290 | 3364 | 16820 |
| $61-65$ | 2 | 63 | 126 | 3969 | 7938 |
| $66-77$ | 2 | 68 | 136 | 4624 | 9248 |
| Total | 50 |  | 2500 |  | 127900 |

## MODULE - V

## Statistics and

Probability

Substituting the values of $\sum_{i=1}^{k}\left(f_{i} x_{i}^{2}\right), N$ and $\sum_{i=1}^{k}\left(f_{i} x_{i}\right)$ in the formula, we obtain

$$
\sigma_{\mathrm{g}}^{2}=\frac{127900-\frac{(2500)^{2}}{50}}{50}=\frac{2900}{50}=58
$$

$$
\sigma_{\mathrm{g}}=+\sqrt{58}=7.61 \text { (approx.) }
$$

and $\quad \sigma_{\mathrm{g}}=+\sqrt{58}=7.61$ (approx.)

Again, we observe that we get the same value of $\sigma_{\mathrm{g}}^{2}$, by either of the methods.

## CHECK YOUR PROGRESS 17.5

1. In a study on effectiveness of a medicine over a group of patients, the following results were obtained:

| Percentage of relief | $0-20$ | $20-40$ | $40-60$ | $60-80$ | $80-100$ |
| :--- | :---: | :---: | :---: | :---: | :---: |
| No. of patients | 10 | 10 | 25 | 15 | 40 |

Find the variance and standard deviation.
2. In a study on ages of mothers at the first child birth in a village, the following data were available :

| Age (in years) <br> at first child birth | $18-20$ | $20-22$ | $22-24$ | $24-26$ | $26-28$ | $28-30$ | $30-32$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| No. of mothers | 130 | 110 | 80 | 74 | 50 | 40 | 16 |

Find the variance and the standard deviation.
3. The daily salaries of 30 workers are given below:

| Daily salary <br> (In Rs.) | $0-50$ | $50-100$ | $100-150$ | $150-200$ | $200-250$ | $250-300$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| No. of workers | 3 | 4 | 5 | 7 | 8 | 3 |

Find variance and standard deviation for the above data.

### 17.10 STANDARD DEVIATION AND VARIANCE: STEP DEVIATION METHOD

In Example 17.12, we have seen that the calculations were very complicated. In order to simplify the calculations, we use another method called the step deviation method. In most of the frequency distributions, we shall be concerned with the equal classes. Let us denote, the class size by $h$.

## Measures of Dispersion

Now we not only take the deviation of each class mark from the arbitrary chosen 'a' but also divide each deviation by h. Let

$$
\begin{equation*}
u_{i}=\frac{x_{i}-a}{h} \tag{1}
\end{equation*}
$$

Then

$$
\begin{equation*}
\mathrm{x}_{\mathrm{i}}=\mathrm{hu} \mathrm{i}_{\mathrm{i}}+\mathrm{a} \tag{2}
\end{equation*}
$$

We know that

$$
\begin{equation*}
\bar{x}=h \bar{u}+a \tag{3}
\end{equation*}
$$

Subtracting (3) from (2), we get

$$
\begin{equation*}
x_{i}-\bar{x}=h\left(u_{i}-\bar{u}\right) \tag{4}
\end{equation*}
$$

In (4), squaring both sides and multiplying by $f_{i}$ and summing over $k$, we get

$$
\begin{equation*}
\sum_{i=1}^{k}\left[f_{i}\left(x_{i}-\bar{x}\right)^{2}\right]=h^{2} \sum_{i=1}^{k}\left[f_{i}\left(u_{i}-\bar{u}\right)^{2}\right] \tag{5}
\end{equation*}
$$

Dividing both sides of (5) by N , we get

$$
\frac{\sum_{i=1}^{k}\left[f_{i}\left(x_{i}-\bar{x}\right)^{2}\right]}{N}=\frac{h^{2}}{N} \sum_{i=1}^{k}\left[f_{i}\left(u_{i}-\bar{u}\right)^{2}\right]
$$

i.e.

$$
\begin{equation*}
\sigma_{\mathrm{x}}^{2}=\mathrm{h}^{2} \sigma_{\mathrm{u}}^{2} \tag{6}
\end{equation*}
$$

where $\sigma_{\mathrm{x}}{ }^{2}$ is the variance of the original data and $\sigma_{\mathrm{u}}{ }^{2}$ is the variance of the coded data or coded variance. $\sigma_{u}{ }^{2}$ can be calculated by using the formula which involves the mean, namely,

$$
\begin{equation*}
\sigma_{\mathrm{u}}^{2}=\frac{1}{\mathrm{~N}} \sum_{\mathrm{i}=1}^{\mathrm{k}}\left[\mathrm{f}_{\mathrm{i}}\left(\mathrm{u}_{\mathrm{i}}-\overline{\mathrm{u}}\right)^{2}\right], \quad \mathrm{N}=\sum_{\mathrm{i}=1}^{\mathrm{k}} \mathrm{f}_{\mathrm{i}} \tag{7}
\end{equation*}
$$

or by using the formula which does not involve the mean, namely,

$$
\begin{equation*}
\sigma_{u}^{2}=\frac{\sum_{i=1}^{k}\left[f_{i} u_{i}^{2}\right]-\frac{\left(\sum_{i=1}^{k}\left[f_{i} u_{i}\right]\right)^{2}}{N}}{N}, \quad N=\sum_{i=1}^{k} f_{i} \tag{8}
\end{equation*}
$$

Example 17.14 We refer to the Example 17.12 again and find the variance and standard deviation using the coded variance.

Solution : Here $\mathrm{h}=5$ and let $\mathrm{a}=48$.

| Yield per Hectare <br> (inquintal) | Number <br> of fields $f_{i}$ | Class | $\mathrm{u}_{\mathrm{i}}=\frac{\mathrm{x}_{\mathrm{i}}-48}{5}$ | $\mathrm{f}_{\mathrm{i}} \mathrm{u}_{\mathrm{i}}$ | $\mathrm{u}_{\mathrm{i}}{ }^{2}$ | $\mathrm{f}_{\mathrm{i}} \mathrm{u}_{\mathrm{i}}{ }^{2}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $31-35$ | 2 | 33 |  |  |  |  |
| $36-40$ | 3 | 38 | -3 | -6 | 9 | 18 |

Thus

$$
\begin{aligned}
& \sigma_{u}^{2}=\frac{\sum_{i=1}^{k} f_{i} u_{i}^{2}-\frac{\left(\sum_{i=1}^{k} f_{i} u_{i}\right)^{2}}{N}}{N} \\
& =\frac{124-\frac{(20)^{2}}{50}}{50}=\frac{124-8}{50} \text { or } \sigma_{u}^{2}=\frac{58}{25}
\end{aligned}
$$

Variance of the original data will be
and

$$
\begin{aligned}
& \sigma_{\mathrm{x}}^{2}=\mathrm{h}^{2} \sigma_{\mathrm{u}}^{2}=25 \times \frac{58}{25}=58 \\
& \sigma_{\mathrm{x}}=+\sqrt{58} \\
& =7.61 \text { (approx) }
\end{aligned}
$$

We, of course, get the same variance, and hence, standard deviation as before.
Example 17.15 Find the standard deviation for the following distribution giving wages of 230 persons.

| Wages <br> (in Rs) | No. of persons | Wages <br> (inRs) | No. of persons |
| :--- | :---: | :---: | :---: |
| $70-80$ | 12 | $110-120$ | 50 |
| $80-90$ | 18 | $120-130$ | 45 |
| $90-100$ | 35 | $130-140$ | 20 |
| $100-110$ | 42 | $140-150$ | 8 |
|  |  |  | MATHEMATICS |

## Solution :

| Wages | No. of | class | $u_{i}=\frac{x_{i}-105}{10}$ | $u_{i}{ }^{2}$ | $f_{i} u_{i}$ | $f_{i} u_{i}{ }^{2}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| (in Rs.) | persons $\mathrm{f}_{\mathrm{i}}$ | mark $\mathrm{x}_{\mathrm{i}}$ |  |  |  |  |
| $70-80$ | 12 | 75 | -3 | 9 | -36 | 108 |
| $80-90$ | 18 | 85 | -2 | 4 | -36 | 72 |
| $90-100$ | 35 | 95 | -1 | 1 | -35 | 35 |
| $100-110$ | 42 | 105 | 0 | 0 | 0 | 0 |
| $110-120$ | 50 | 115 | +1 | 1 | 50 | 50 |
| $120-130$ | 45 | 125 | +2 | 4 | 90 | 180 |
| $130-140$ | 20 | 135 | +3 | 9 | 60 | 180 |
| $140-150$ | 8 | 145 | +4 | 16 | 32 | 128 |
| Total | 230 |  |  |  | 125 | 753 |

$$
\begin{array}{ll} 
& \sigma^{2}=\mathrm{h}^{2}\left[\frac{1}{\mathrm{~N}} \sum\left[\mathrm{f}_{\mathrm{i}} \mathrm{u}_{\mathrm{i}}^{2}\right]-\left(\frac{1}{\mathrm{~N}} \sum\left[\mathrm{f}_{\mathrm{i}} \mathrm{u}_{\mathrm{i}}\right]\right)^{2}\right] \\
& =100\left[\frac{753}{230}-\left(\frac{125}{230}\right)^{2}\right]=100(3.27-0.29)=298 \\
\therefore \quad & \sigma=+\sqrt{298}=17.3 \text { (approx) }
\end{array}
$$

## (.) CHECK YOUR PROGRESS 17.6

1. The data written below gives the daily earnings of 400 workers of a flour mill.

| Weekly earning (in Rs.) | No. of Workers |
| :---: | :---: |
| $80-100$ | 16 |
| $100-120$ | 20 |
| $120-140$ | 25 |
| $140-160$ | 40 |
| $160-180$ | 80 |
| $180-200$ | 65 |
| $200-220$ | 60 |
| $220-240$ | 35 |
| $240-260$ | 30 |
| $260-280$ | 20 |
| $280-300$ | 9 |

Calculate the variance and standard deviation using step deviation method.

MODULE - V
Sores
2. The data on ages of teachers working in a school of a city are given below:

| Age (in years) | $20-25$ | $25-30$ | $30-35$ | $35-40$ |
| :--- | :---: | :---: | :---: | :---: |
| No. of teachers | 25 | 110 | 75 | 120 |
| Age (in years) | $40-45$ | $45-50$ | $50-55$ | $55-60$ |
| No. of teachers | 100 | 90 | 50 | 30 |

Calculate the variance and standard deviation using step deviation method.
3. Calculate the variance and standard deviation using step deviation method of the following data:

| Age (in years) | $25-30$ | $30-35$ | $35-40$ |
| :--- | :---: | :---: | :---: |
| No. of persons | 70 | 51 | 47 |
| Age (in years) | $40-50$ | $45-50$ | $50-55$ |
| No. of persons | 31 | 29 | 22 |

### 17.11 PROPERTIES OF VARIANCE AND STANDARD DEVIA TION

Property I: The variance is independent of change of origin.
To verify this property let us consider the example given below.
Example : 17.16 The marks of 10 students in a particular examination are as follows:
$10 \quad 12$
$15 \quad 12$
16
20
13
$17 \quad 15$
10

Later, it was decided that 5 bonus marks will be awarded to each student. Compare the variance and standard deviation in the two cases.

Solution : Case -I

|  | $\mathrm{x}_{\mathrm{i}}$ | $\mathrm{f}_{\mathrm{i}}$ | $\mathrm{f}_{\mathrm{i}} \mathrm{x}_{\mathrm{i}}$ | $\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}$ | $\left(x_{i}-\bar{x}\right)^{2}$ | $\mathrm{f}_{\mathrm{i}}\left(\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right)^{2}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 10 | 2 | 20 | -4 | 16 | 32 |
|  | 12 | 2 | 24 | -2 | 4 | 8 |
|  | 13 | 1 | 13 | -1 | 1 | 1 |
|  | 15 | 2 | 30 | 1 | 1 | 2 |
|  | 16 | 1 | 16 | 2 | 4 | 4 |
|  | 17 | 1 | 17 | 3 | 9 | 9 |
|  | 20 | 1 | 20 | 6 | 36 | 36 |
|  |  | 10 | 140 |  |  | 92 |
| Here |  |  | $=\frac{140}{10}$ |  |  |  |

## Measures of Dispersion

Variance

$$
\begin{aligned}
& =\frac{\sum\left[\mathrm{f}_{\mathrm{i}}\left(\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right)^{2}\right]}{10} \\
& =\frac{92}{10}=9.2
\end{aligned}
$$

Standard deviation $=+\sqrt{9.2}=3.03$

Case -II (By adding 5 marks to each $\mathrm{x}_{\mathrm{i}}$ )

| $\mathrm{x}_{\mathrm{i}}$ | $\mathrm{f}_{\mathrm{i}}$ | $\mathrm{f}_{\mathrm{i}} \mathrm{x}_{\mathrm{i}}$ | $\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}$ | $\left(\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right)^{2}$ | $\mathrm{f}_{\mathrm{i}}\left(\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right)^{2}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 15 | 2 | 30 | -4 | 16 | 32 |
| 17 | 2 | 34 | -2 | 4 | 8 |
| 18 | 1 | 18 | -1 | 1 | 1 |
| 20 | 2 | 40 | 1 | 1 | 2 |
| 21 | 1 | 21 | 2 | 4 | 4 |
| 22 | 1 | 22 | 3 | 9 | 9 |
| 25 | 1 | 25 | 6 | 36 | 36 |
|  | 10 | 190 |  |  | 92 |

$$
\begin{array}{rr} 
& \bar{x}=\frac{190}{10}=19 \\
\therefore & \text { Variance }=\frac{92}{10}=9.2
\end{array}
$$

$$
\text { Standard deviation }=+\sqrt{9.2}=3.03
$$

Thus, we see that there is no change in variance and standard deviation of the given data if the origin is changed i.e., if a constant is added to each observation.

Property II : The variance is not independent of the change of scale.
Example 17.17 In the above example, if each observation is multiplied by 2 , then discuss the change in variance and standard deviation.
Solution : In case-I of the above example , we have variance $=9.2$, standard deviation $=3.03$. Now, let us calculate the variance and the Standard deviation when each observation is multiplied by 2 .

| $\mathrm{x}_{\mathrm{i}}$ | $\mathrm{f}_{\mathrm{i}}$ | $\mathrm{f}_{\mathrm{i}} \mathrm{x}_{\mathrm{i}}$ | $\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}$ | $\left(\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right)^{2}$ | $\mathrm{f}_{\mathrm{i}}\left(\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right)^{2}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 20 | 2 | 40 | -8 | 64 | 128 |
| 24 | 2 | 48 | -4 | 16 | 32 |
| 26 | 1 | 26 | -2 | 4 | 4 |
| 30 | 2 | 60 | 2 | 4 | 8 |
| 32 | 1 | 32 | 4 | 16 | 16 |
| 34 | 1 | 34 | 6 | 36 | 36 |
| 40 | 1 | 40 | 12 | 144 | 144 |
|  | 10 | 280 |  | 368 |  |

## MODULE - V

Statistics and Probability

Notes

$$
\overline{\mathrm{x}}=\frac{280}{10}=28, \text { Variance }=\frac{368}{10}=36.8
$$

$$
\text { Standard deviation }=+\sqrt{36.8}=6.06
$$

Here we observe that, the variance is four times the original one and consequently the standard deviation is doubled.

In a similar way we can verify that if each observation is divided by a constant then the variance of the new observations gets divided by the square of the same constant and consequently the standard deviation of the new observations gets divided by the same constant.

Property III : Prove that the standard deviation is the least possible root mean square deviation.
Proof: Let $\overline{\mathrm{x}}-\mathrm{a}=\mathrm{d}$
By definition, we have

$$
\begin{aligned}
\mathrm{s}^{2} & =\frac{1}{\mathrm{~N}} \sum\left[\mathrm{f}_{\mathrm{i}}\left(\mathrm{x}_{\mathrm{i}}-\mathrm{a}\right)^{2}\right]=\frac{1}{\mathrm{~N}} \sum\left[\mathrm{f}_{\mathrm{i}}\left(\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}+\overline{\mathrm{x}}-\mathrm{a}\right)^{2}\right] \\
& =\frac{1}{\mathrm{~N}} \sum \mathrm{f}_{\mathrm{i}}\left[\left(\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right)^{2}+2\left(\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right)(\overline{\mathrm{x}}-\mathrm{a})+(\overline{\mathrm{x}}-\mathrm{a})^{2}\right] \\
& =\frac{1}{\mathrm{~N}} \sum \mathrm{f}_{\mathrm{i}}\left(\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right)^{2}+\frac{2}{\mathrm{~N}}(\overline{\mathrm{x}}-\mathrm{a}) \sum \mathrm{f}_{\mathrm{i}}\left(\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right)+\frac{(\overline{\mathrm{x}}-\mathrm{a})^{2}}{\mathrm{~N}} \sum \mathrm{f}_{\mathrm{i}} \\
& =\sigma^{2}+0+\mathrm{d}^{2}
\end{aligned}
$$

$\therefore$ The algebraic sum of deviations from the mean is zero
or

$$
s^{2}=\sigma^{2}+d^{2}
$$

Clearly $\mathrm{s}^{2}$ will be least when $\mathrm{d}=0$ i.e., when $\mathrm{a}=\overline{\mathrm{x}}$.
Hence the root mean square deviation is the least when deviations are measured from the mean i.e., the standard deviation is the least possible root mean square deviation.

Property IV: The standard deviations of two sets containing $\mathrm{n}_{1}$, and $\mathrm{n}_{2}$ numbers are $\sigma_{1}$ and $\sigma_{2}$ respectively being measured from their respective means $m_{1}$ and $m_{2}$. If the two sets are grouped together as one of $\left(n_{1}+n_{2}\right)$ numbers, then the standard deviation $\sigma$ of this set, measured from its mean mis given by

$$
\sigma^{2}=\frac{\mathrm{n}_{1} \sigma_{1}^{2}+\mathrm{n}_{2} \sigma_{2}^{2}}{\mathrm{n}_{1}+\mathrm{n}_{2}}+\frac{\mathrm{n}_{1} \mathrm{n}_{2}}{\left(\mathrm{n}_{1}+\mathrm{n}_{2}\right)^{2}}\left(\mathrm{~m}_{1}-\mathrm{m}_{2}\right)^{2}
$$

Example 17.18 The means of two samples of sizes 50 and 100 respectively are 54.1 and 50.3; the standard deviations are 8 and 7. Find the standard deviation of the sample of size 150 by combining the two samples.

Solution : Here we have

$$
\begin{aligned}
& \mathrm{n}_{1}=50, \mathrm{n}_{2}=100, \mathrm{~m}_{1}=54.1, \mathrm{~m}_{2}=50.3 \\
& \sigma_{1}=8 \text { and } \sigma_{2}=7 \\
& \sigma^{2}=\frac{\mathrm{n}_{1} \sigma_{1}^{2}+\mathrm{n}_{2} \sigma_{2}^{2}}{\left(\mathrm{n}_{1}+\mathrm{n}_{2}\right)}+\frac{\mathrm{n}_{1} \mathrm{n}_{2}}{\left(\mathrm{n}_{1}+\mathrm{n}_{2}\right)^{2}}\left(\mathrm{~m}_{1}-\mathrm{m}_{2}\right)^{2} \\
& =\frac{(50 \times 64)+(100 \times 49)}{150}+\frac{50 \times 100}{(150)^{2}}(54.1-50.3)^{2} \\
& =\frac{3200+4900}{150}+\frac{2}{9}(3.8)^{2}=57.21
\end{aligned}
$$

$$
\therefore \quad \sigma=7.56 \text { (approx) }
$$

Example 17.19 Find the mean deviation (M.D) from the mean and the standard deviation
(S.D) of the A.P.

$$
\mathrm{a}, \mathrm{a}+\mathrm{d}, \mathrm{a}+2 \mathrm{~d}, \ldots \ldots, \mathrm{a}+2 \mathrm{n} . \mathrm{d}
$$

and prove that the latter is greater than the former.
Solution : The number of items in the A.P. is $(2 n+1)$
$\therefore \quad \overline{\mathrm{x}}=\mathrm{a}+\mathrm{nd}$
Mean deviation about the mean

$$
\begin{align*}
& =\frac{1}{(2 n+1)} \sum_{r=0}^{2 n}|(a+r d)-(a+n d)| \\
& =\frac{1}{(2 n+1)} \cdot 2[n d+(n-1) d+\ldots \ldots+d] \\
& =\frac{2}{(2 n+1)}[1+2+\ldots . .+(n-1)+n] d \\
& =\frac{2 n(n+1)}{(2 n+1) 2} \cdot d \quad=\frac{n(n+1) d}{(2 n+1)} \tag{1}
\end{align*}
$$

Now

$$
\begin{aligned}
& \sigma^{2}=\frac{1}{(2 n+1)} \sum_{r=0}^{2 n}[(a+r d)-(a+n d)]^{2} \\
& =\frac{2 d^{2}}{(2 n+1)}\left[n^{2}+(n-1)^{2}+\ldots .+2^{2}+1^{2}\right]
\end{aligned}
$$

## MODULE - V

Statistics and Probability

$$
\begin{align*}
& =\frac{2 d^{2}}{(2 \mathrm{n}+1)} \cdot \frac{\mathrm{n}(\mathrm{n}+1)(2 \mathrm{n}+1)}{6}=\frac{\mathrm{n}(\mathrm{n}+1) \mathrm{d}^{2}}{3} \\
\therefore \quad & \sigma=\mathrm{d} \cdot \sqrt{\left(\frac{\mathrm{n}(\mathrm{n}+1)}{3}\right)} \tag{2}
\end{align*}
$$

Notes
We have further, (2) >(1)

$$
\mathrm{d} \sqrt{\left(\frac{\mathrm{n}(\mathrm{n}+1)}{3}\right)}>\frac{\mathrm{n}(\mathrm{n}+1)}{(2 \mathrm{n}+1)} \mathrm{d}
$$

or if

$$
(2 \mathrm{n}+1)^{2}>3 \mathrm{n}(\mathrm{n}+1)
$$

or if $\quad n^{2}+n+1>0$, which is true for $n>0$
Hence the result.

Example 17.20 Show that for any discrete distribution the standard deviation is not less than the mean deviation from the mean.

Solution : We are required to show that

$$
\begin{aligned}
& \text { S.D. } \geq \text { M.D. from mean } \\
& \text { (S. D })^{2} \geq(\text { M.D. from mean })^{2} \\
& \frac{1}{\mathrm{~N}} \sum\left[\mathrm{f}_{\mathrm{i}}\left(\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right)^{2}\right] \geq\left[\frac{1}{\mathrm{~N}} \sum\left[\mathrm{f}_{\mathrm{i}}\left|\left(\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right)\right|\right]\right]^{2} \\
& \frac{1}{\mathrm{~N}} \sum\left[\mathrm{f}_{\mathrm{i}} \mathrm{~d}_{\mathrm{i}}^{2}\right] \geq\left[\frac{1}{\mathrm{~N}} \sum\left[\mathrm{f}_{\mathrm{i}}\left|\mathrm{~d}_{\mathrm{i}}\right|\right]\right]^{2}, \text { where } \mathrm{d}_{\mathrm{i}}=\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}} \\
& \mathrm{~N} \sum\left(\mathrm{f}_{\mathrm{i}} \mathrm{~d}_{\mathrm{i}}^{2}\right) \geq\left[\sum\left\{\mathrm{f}_{\mathrm{i}}\left|\mathrm{~d}_{\mathrm{i}}\right|\right\}\right]^{2} \\
& \left(\mathrm{f}_{1}+\mathrm{f}_{2}+\ldots .\right)\left(\mathrm{f}_{1} \mathrm{~d}_{1}^{2}+\mathrm{f}_{2} \mathrm{~d}_{2}^{2}+\ldots \ldots . .\right) \geq\left[\mathrm{f}_{1}\left|\mathrm{~d}_{1}\right|+\mathrm{f}_{2}\left|\mathrm{~d}_{2}\right|+\ldots . .\right]^{2} \\
& \mathrm{f}_{1} \mathrm{f}_{2}\left(\mathrm{~d}_{1}^{2}+\mathrm{d}_{2}^{2}\right)+\ldots . . \geq 2 \mathrm{f}_{1} \mathrm{f}_{2} \mathrm{~d}_{1} \mathrm{~d}_{2}+\ldots . . \\
& \mathrm{f}_{1} \mathrm{f}_{2}\left(\mathrm{~d}_{1}-\mathrm{d}_{2}\right)^{2}+\ldots . . \geq 0
\end{aligned}
$$

which is true being the sum of perfect squares.

## Measures of Dispersion

### 17.12 ANALYSIS OF FREQUENCY DISTRIBUTIONS WITH EQUAL MEANS

The variability of two series with same mean can be compared when the measures of variation are absolute and are free of units. For this, coefficient of variation (C.V.) is obtained which is defined as

$$
\text { C.V. }=\frac{\sigma}{\bar{x}} \times 100, \bar{x} \neq 0
$$

where $\sigma$ and $\bar{x}$ are standard deviation and mean of the data. The coefficients of variation are compared to compare the variability of two series. The series with greater C.V. is said to be more variable than the other. The series having less C.V. is said to be more consistent than the other.

For series with same means, we can have

$$
\begin{align*}
& \text { C.V. }(1 \text { st distribution })=\frac{\sigma_{1}}{\bar{x}} \times 100  \tag{1}\\
& \text { C.V. }(2 \text { nd distribution })=\frac{\sigma_{2}}{\bar{x}} \times 100 \tag{2}
\end{align*}
$$

where $\sigma_{1}, \sigma_{2}$ are standard deviation of the Ist and 2nd distribution respectively, $\bar{x}$ is the equal mean of the distributions.

From (1) and (2), we can conclude that two C.V.'s can be compared on the basis of the values of $\sigma_{1}$ and $\sigma_{2}$ only.

Example 17.21 The standard deviation of two distributions are 21 and 14 and their equal mean is 35 . Which of the distributions is more variable?

Solution : Let

$$
\begin{aligned}
\sigma_{1} & =\text { Standard dev. of } 1 \text { st series }=21 \\
\sigma_{2} & =\text { Standard dev. of } 2 \text { nd series }=14 \\
\bar{x} & =35
\end{aligned}
$$

C.V. $($ Series I$)=\frac{\sigma_{1}}{\bar{x}} \times 100=\frac{21}{35} \times 100=60$
C.V. $($ Series II $)=\frac{\sigma_{1}}{\bar{x}} \times 100=\frac{14}{35} \times 100=40$
C.V. of series I > C.V. of series II
$\Rightarrow$ Series with S.D $=21$ is more variable .

MODULE - V
Statistics and Probability

Example 17.22 Monthly wages paid to workers in two factories A and B and other data are given below :

Factory A
Mean of monthly wages
Variance of the distribution of wages
Which factory A or B shows greater variablility in individual wages?
Solution : Given

$$
\begin{aligned}
\sigma_{\mathrm{A}} & =\sqrt{\text { variance }}=\sqrt{100}=10 \\
\sigma_{\mathrm{B}} & =\sqrt{\text { variance }}=\sqrt{121}=11 \\
\bar{x} & =15550
\end{aligned}
$$

Now,

$$
\begin{aligned}
& \text { C.V. }(A)=\frac{\sigma_{A}}{\bar{x}} \times 100=\frac{10}{15550} \times 100 \\
& =0.064 \\
& \text { C.V.(B) }=\frac{\sigma_{B}}{\bar{x}} \times 100=\frac{11}{15550} \times 100=0.07
\end{aligned}
$$

Clearly C.V. (B) > C.V.(A)
$\therefore \quad$ Factory B has greater variability in the individual wages.
Example 17.23 Which of the following series X or Y is more consistent?

| X | 58 | 52 | 50 | 51 | 49 | 35 | 54 | 52 | 53 | 56 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Y | 101 | 104 | 103 | 104 | 107 | 106 | 105 | 105 | 107 | 108 |

Solution : From the given data we have following table

| X | Y | $\mathrm{D}_{i}=\mathrm{X}-\overline{\mathrm{X}}$ | $\mathrm{D}_{i}{ }^{2}$ | $d_{i}=Y-\bar{Y}$ | $d_{i}{ }^{2}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 58 | 101 | 7 | 49 | -4 | 16 |
| 52 | 104 | 1 | 1 | -1 | 1 |
| 50 | 103 | -1 | 1 | -2 | 4 |
| 51 | 104 | 0 | 0 | -1 | 1 |
| 49 | 107 | -2 | 4 | 2 | 4 |
| 35 | 106 | -16 | 256 | 1 | 1 |
| 54 | 105 | 3 | 9 | 0 | 0 |
| 52 | 105 | 1 | 1 | 0 | 0 |
| 53 | 107 | 2 | 4 | 2 | 4 |
| 56 | 108 | 5 | 25 | 3 | 9 |
| $\Sigma \mathrm{X}=510$ | $\Sigma \mathrm{Y}=1050$ |  | $\Sigma \mathrm{D}_{i}^{2}=350$ |  | $\Sigma d_{i}^{2}=40$ |

Now,

$$
\begin{aligned}
\bar{X} & =\frac{\Sigma X_{i}}{10}=\frac{510}{10}=51 \\
\bar{Y} & =\frac{\Sigma Y_{i}}{10}=\frac{1050}{10}=105 \\
\sigma_{x} & =\sqrt{\frac{\Sigma(X-\bar{X})^{2}}{N}}=\sqrt{\frac{\Sigma D_{i}^{2}}{N}}=\sqrt{\frac{350}{10}} \\
& =5.9 \\
\sigma_{y} & =\sqrt{\frac{\Sigma(Y-\bar{Y})^{2}}{N}}=\sqrt{\frac{\Sigma d_{i}^{2}}{N}}=\sqrt{\frac{40}{10}}=2
\end{aligned}
$$

Now,

$$
\begin{aligned}
& \text { C.V. }(\mathrm{X})=\frac{\sigma_{X}}{X} \times 100=\frac{5.9}{51} \times 100=11.5 \\
& \text { C.V. }(\mathrm{Y})=\frac{\sigma_{Y}}{Y} \times 100=\frac{2}{105} \times 100=1.9
\end{aligned}
$$

Clearly C.V.(Y) < C.V.(X) $\therefore$ Series Y is more consistent.

## CHECK YOUR PROGRESS 17.7

1. From the data given below which section is more variable?

| Marks | $0-10$ | $10-20$ | $20-30$ | $30-40$ | $40-50$ |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Section A | 9 | 10 | 40 | 33 | 8 |
| Section B | 8 | 15 | 43 | 25 | 9 |

2. Which of the factory give better consistent wages to workers?

\begin{tabular}{|l|c|c|c|c|c|}

\hline | Wages (in `) |
| :--- |
| per day | \& $100-150$ \& $150-200$ \& $200-250$ \& $250-300$ \& $300-350$ <br>

\hline Factory A \& 35 \& 45 \& 50 \& 42 \& 28 <br>
\hline Factory B \& 16 \& 50 \& 55 \& 13 \& 46 <br>
\hline
\end{tabular}

3. Two schools show following results of board examination in a year

|  | School A | School B |
| :--- | :---: | :---: |
| Average Marks Obtained | 250 | 225 |
| No. of Students Appeared | 62 | 62 |
| Variance of distribution of marks | 2.25 | 2.56 |

Which school has greater variability in individual marks?

## LET US SUM UP

- Range : The difference between the largest and the smallest value of the given data.

Mean deviation from mean $=\frac{\sum_{i=1}^{n}\left(f_{i}\left|x_{i}-\bar{x}\right|\right)}{N}$
where $\quad \mathrm{N}=\sum_{\mathrm{i}=1}^{\mathrm{n}} \mathrm{f}_{\mathrm{i}}, \quad \overline{\mathrm{x}}=\frac{1}{\mathrm{~N}} \sum_{\mathrm{i}=1}^{\mathrm{n}}\left(\mathrm{f}_{\mathrm{i}} \mathrm{x}_{\mathrm{i}}\right)$
Mean deviation from median $=\frac{\sum_{i=1}^{n} f i|x i-m|}{N}$
Where $\quad N=\frac{\sum_{i=1}^{n} f i}{N}$,
$M=l+\frac{\frac{N}{2}-C}{f} \times i$
$\operatorname{Variance}\left(\sigma^{2}\right)=\frac{\sum_{i=1}^{n}\left(x_{i}-\bar{x}\right)^{2}}{n}$ [for raw data]

Standard derivation $(\sigma)=+\sqrt{\frac{\sum_{i=1}^{n}\left(x_{i}-\bar{x}\right)^{2}}{n}}$
Variance for grouped data
$\sigma_{g}^{2}=\frac{\sum_{i=1}^{k}\left[f_{i}\left(x_{i}-\bar{x}\right)^{2}\right]}{N}, x_{i}$ is the mid value of the class.
Also, $\sigma_{\mathrm{x}}{ }^{2}=\mathrm{h}^{2} \sigma_{\mathrm{u}}{ }^{2}$ and $\sigma_{\mathrm{u}}{ }^{2}=\frac{1}{\mathrm{~N}} \sum_{\mathrm{i}=1}^{\mathrm{k}}\left[\mathrm{f}_{\mathrm{i}}\left(\mathrm{u}_{\mathrm{i}}-\overline{\mathrm{u}}^{2}\right)\right]$

$$
\mathrm{N}=\sum_{\mathrm{i}=1}^{\mathrm{k}} \mathrm{f}_{\mathrm{i}}
$$

or $\quad \sigma_{u}^{2}=\frac{\sum_{i=1}^{k}\left(f_{i} u_{i}^{2}\right)-\frac{\left[\sum_{i=1}^{k}\left(f_{i} u_{i}^{2}\right)\right]^{2}}{N}}{N} \quad$ where $N=\sum_{i=1}^{k} f_{i}$

- Standard deviation for grouped data $\sigma_{\mathrm{g}}=+\sqrt{\sigma_{\mathrm{g}}^{2}}$
- If two frequency distributions have same mean, then the distribution with greater Coefficient of variation (C.V) is said to be more variable than the other.

http:// en.wikipedia.org/wiki/Statistical_dispersion simon.cs.vt.edu/SoSci/converted/Dispersion_I/activity.html

## 9 <br> TERMINAL EXERCISE

1. Find the mean deviation for the following data of marks obtained (out of 100) by 10 students in a test

| 55 | 45 | 63 | 76 | 67 | 84 | 75 | 48 | 62 | 65 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

2. The data below presents the earnings of 50 labourers of a factory

| Earnings (in Rs.) | 1200 | 1300 | 1400 | 1500 | 1600 | 1800 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

$\begin{array}{llllllll}\text { No. of Labourers } & 4 & 7 & 15 & 12 & 7 & 5\end{array}$
Calculate mean deviation.
3. The salary per day of 50 employees of a factory is given by the following data.

| Salary (in Rs.) | $20-30$ | $30-40$ | $40-50$ | $50-60$ |
| :--- | :---: | :---: | :---: | :---: |
| No. of employees | 4 | 6 | 8 | 12 |
| Salary (in rupees) | $60-70$ | $70-80$ | $80-90$ | $90-100$ |
| No. of employees | 7 | 6 | 4 | 3 |

Calculate mean deviation.
4. Find the batting average and mean deviation for the following data of scores of 50 innings of a cricket player:

| Run Scored | $0-20$ | $20-40$ | $40-60$ | $60-80$ |
| :--- | :---: | :---: | :---: | :---: |
| No. of Innings | 6 | 10 | 12 | 18 |
| Run scored | $80-100$ | $100-120$ |  |  |
| No. of innings | 3 | 1 |  |  |

## MODULE - V

Statistics and Probability

5. The marks of 10 students in a test of Mathematics are given below:

| 6 | 10 | 12 | 13 | 15 | 20 | 24 | 28 | 30 | 32 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

Find the variance and standard deviation of the above data.
6. The following table gives the masses in grams to the nearest gram, of a sample of 10 eggs.

| 46 | 51 | 48 | 62 | 54 | 56 | 58 | 60 | 71 | 75 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

Calculate the standard deviation of the masses of this sample.
7. The weekly income (in rupees ) of 50 workers of a factory are given below:

| Income | 400 | 425 | 450 | 500 | 550 | 600 | 650 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| No of workers | 5 | 7 | 9 | 12 | 7 | 6 | 4 |

Find the variance and standard deviation of the above data.
8. Find the variance and standard deviation for the following data:

| Class | $0-20$ | $20-40$ | $40-60$ | $60-80$ | $80-100$ |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Frequency | 7 | 8 | 25 | 15 | 45 |

9. Find the standard deviation of the distribution in which the values of x are $1,2, \ldots \ldots, \mathrm{~N}$ The frequency of each being one.
10. The following values are calculated in respect of heights and weights of students :
Weight Height
Mean $\quad 52.5 \mathrm{Kg} \quad 160.5 \mathrm{~cm}$
$\begin{array}{lll}\text { Standard Dev. } 11.5 & 12.2\end{array}$
Which of the attribute weight or height show greater variation?
11. The following are the wickets taken by a bowler in 20 matches, for Player A

| No. of Wickets | 0 | 1 | 2 | 3 | 4 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| No. of Matches | 2 | 6 | 7 | 4 | 1 |

For the bowler B, mean number of wickets taken in 20 matches is 1.6 with standard deviation 1.25. Which of the players is more consistent?
Find the median of the following distributions (12-14) :

| 12. $x_{i}$ | 14 | 20 | 26 | 29 | 34 | 46 |
| ---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $f_{i}$ | 4 | 6 | 7 | 8 | 9 | 6 |

13. Age (in years) $\quad 15-19 \quad 20-24 \quad 25-29 \quad 30-34 \quad 35-39$
$\begin{array}{llllll}\text { Number } & 8 & 7 & 9 & 11 & 5\end{array}$

## Measures of Dispersion

14. Height (in cm ) 95-104 105-114 115-124 125-134 135-144 $\begin{array}{llllll}\text { Number of Boys } & 10 & 8 & 18 & 8 & 16\end{array}$

Find mean deviation from median (15-18) :

| 15. | $x_{i}$ | 5 | 15 | 25 | 35 | 45 | 55 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $f_{i}$ | 5 | 23 | 30 | 20 | 16 | 6 |
| 16. | $x_{i}$ | 105 | 107 | 109 | 111 | 113 | 115 |
|  | $f_{i}$ | 8 | 6 | 2 | 2 | 2 | 6 |

\begin{tabular}{lccccc}
17. Income (per month) \& $0-5$ \& $6-10$ \& $11-15$ \& $16-20$ \& $21-25$ <br>

| (` in ‘000) |
| :--- | \& \& \& \& <br>

Number of Persons \& 5 \& 6 \& 12 \& 14 \& 26
\end{tabular}

18. Age (in years) $0-5 \quad 6-10 \quad 11-15 \quad 16-20 \quad 21-25 \quad 26-30 \quad 31-35 \quad 36-40$
$\begin{array}{lllllllll}\text { No. of Persons } & 5 & 6 & 12 & 14 & 26 & 32 & 16 & 29\end{array}$
